# Package 'psychTools'

March 24, 2025

**Version** 2.5.3

**Date** 2025-03-17

**Title** Tools to Accompany the 'psych' Package for Psychological
Research

**Description** Support functions, data sets, and vignettes for the 'psych' package. Contains several of the biggest data sets for the 'psych' package as well as four vignettes. A few helper functions for file manipulation are included as well. For more information, see the <https://personality-project.org/r/> web page.

**License** GPL (>= 2)

**Imports** psych,foreign,rtf

**Suggests** parallel, GPArotation, lavaan,knitr

**Depends** R(>= 2.10)

**LazyData** yes

**ByteCompile** TRUE

**VignetteBuilder** knitr

**URL** https://personality-project.org/r/psych/

https://personality-project.org/r/psych-manual.pdf

**NeedsCompilation** no

**Author** William Revelle [aut, cre] (<https://orcid.org/0000-0003-4880-9610>)

**Maintainer** William Revelle <revelle@northwestern.edu>

**Repository** CRAN

**Date/Publication** 2025-03-23 23:40:01 UTC

ability *16 ability items scored as correct or incorrect.*

---

### Description

16 multiple choice ability items 1525 subjects taken from the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project are saved as `iqitems`. Those data are shown as examples of how to score multiple choice tests and analyses of response alternatives. When scored correct or incorrect, the data are useful for demonstrations of tetrachoric based factor analysis `irt.fa` and finding tetrachoric correlations.

### Usage

```
data(iqitems)
```

### Format

A data frame with 1525 observations on the following 16 variables. The number following the name is the item number from SAPA.

`reason.4` Basic reasoning questions

`reason.16` Basic reasoning question

`reason.17` Basic reasoning question

`reason.19` Basic reasoning question

`letter.7` In the following alphanumeric series, what letter comes next?

`letter.33` In the following alphanumeric series, what letter comes next?

`letter.34` In the following alphanumeric series, what letter comes next

`letter.58` In the following alphanumeric series, what letter comes next?

`matrix.45` A matrix reasoning task

`matrix.46` A matrix reasoning task

`matrix.47` A matrix reasoning task

`matrix.55` A matrix reasoning task

`rotate.3` Spatial Rotation of type 1.2

`rotate.4` Spatial Rotation of type 1.2

`rotate.6` Spatial Rotation of type 1.1

`rotate.8` Spatial Rotation of type 2.3

## Details

16 items were sampled from 80 items given as part of the SAPA (`https://www.sapa-project.org/`) project (Revelle, Wilt and Rosenthal, 2009; Condon and Revelle, 2014) to develop online measures of ability. These 16 items reflect four lower order factors (verbal reasoning, letter series, matrix reasoning, and spatial rotations. These lower level factors all share a higher level factor ('g').

This data set may be used to demonstrate item response functions, `tetrachoric` correlations, or `irt.fa` as well as `omega` estimates of of reliability and hierarchical structure.

In addition, the data set is a good example of doing item analysis to examine the empirical response probabilities of each item alternative as a function of the underlying latent trait. When doing this, it appears that two of the matrix reasoning problems do not have monotonically increasing trace lines for the probability correct. At moderately high ability (theta = 1) there is a decrease in the probability correct from theta = 0 and theta = 2.

## Source

The example data set is taken from the Synthetic Aperture Personality Assessment personality and ability test at `https://www.sapa-project.org/`. The data were collected with David Condon from 8/08/12 to 8/31/12.

Similar data are available from the International Cognitive Ability Resource at `https://www.icar-project.org/`.

affect                          *Two data sets of affect and arousal scores as a function of personality and movie conditions*

---

### Description

A recurring question in the study of affect is the proper dimensionality and the relationship to various personality dimensions. Here is a data set taken from two studies of mood and arousal using movies to induce affective states.

### Usage

```
data(affect)
```

### Details

These are data from two studies conducted in the Personality, Motivation and Cognition Laboratory at Northwestern University. Both studies used a similar methodology:

Collection of pretest data using 5 scales from the Eysenck Personality Inventory and items taken from the Motivational State Questionnaire (see msq. In addition, state and trait anxiety measures were given. In the "maps" study, the Beck Depression Inventory was given also.

Then subjects were randomly assigned to one of four movie conditions: 1: Frontline. A documentary about the liberation of the Bergen-Belsen concentration camp. 2: Halloween. A horror film. 3: National Geographic, a nature film about the Serengeti plain. 4: Parenthood. A comedy. Each film clip was shown for 9 minutes. Following this the MSQ was given again.

Data from the MSQ were scored for Energetic and Tense Arousal (EA and TA) as well as Positive and Negative Affect (PA and NA).

Study flat had 170 participants, study maps had 160.

These studies are described in more detail in various publications from the PMC lab. In particular, Revelle and Anderson, 1997 and Rafaeli and Revelle (2006). An analysis of these data has also appeared in Smillie et al. (2012).

For a much more complete data set involving film, caffeine, and time of day manipulations, see the `msqR` data set.

Athenstaedt                          *Gender Role Self Concept data from Athenstaedt (2003)*

---

## Description

Athenstaedt (2003) examined Gender Role Self-Concept. She reports two independent dimensions of Male and Female behaviors. While there are large gender/sex differences on both of these dimensions, the two represent independent factorsl Eagly and Revelle (2022) have used these data to explore the power of aggregation when examining sex differences. This data set is also useful to show various graphical display procedures.

## Usage

```
data("Athenstaedt")
```

**Format**

A data frame with 576 observations on the following 117 variables.

STUDIE a numeric vector

gender Male =1, Female= 2

**V1 - V74** self report items (see Athenstaedt.dictionary)

**V1** Gender (Male = 1, Female =2)

**V2** To pay attention to ones appearance in the office

**V3** Offer fire to somebody

**V4** Paint an Apartment

**V5** Mow the Lawn

**V6** Make the Bed

**V7** Hold the Door Open for your Partner

**V8** Do the Dishes

**V9** Do Extreme Sports

**V10** Tinker with the Car

**V11** Talk about Sports

**V12** Assemble Prefabricated Furniture

**V13** Drive a Car in a Risky Way

**V14** Listen Attentively to Others

**V15** Tell your Partner about Problems at Work

**V16** Play on a Computer

**V17** Set the Table

**V18** Watch ones Weight

**V19** Care for a Partner if he/she is Ill

**V20** Play Chess

**V21** Meet with friends at a Regulars Table

**V22** Watch Soap Operas

**V23** Take a Friends Arm

**V24** Wrap Presents Beautifully

**V25** In case of Vacation with Partner Packing the Luggage for Both

**V26** To admit own Occupational Weekness

**V27** Work Overtime

**V28** Openly Show Vulnerability

**V29** Babysit

**V30** Change Fuses

**V31** Clean a Drain

**V32** Take Care of Somebody

**V33** Do Repair Work

**V34** Change Light Bulbs

**V35** Wash the Car

**V36** Ride a Motorcycle

**V37** Cook Meat on the Grill

**V38** Thump Carpets

**V39** Dust the Furniture

**V40** Buy Electric Appliances

**V41** Go Dancing

**V42** Go for a Walk through Town

**V43** Go to the Ballet

**V44** Hug a Friend

**V45** Do Handiwork (e.g. Knitting)

**V46** Change Bed Sheets

**V47** Sew on a Button

**V48** Do Aerobics

**V49** Watch Sports on Television

**V50** Talk about Problems

**V51** Play Parlor Games

**V52** Talk about Politics

**V53** Take Care of Flowers

**V54** Make Coffee in the Office

**V55** Shovel Snow

**V56** Read non-Fiction Books

**V57** Organize Company Parties

**V58** Do Home Improvement Jobs

**V59** Plead for the Socially Disadvantaged

**V60** Buy a Present for a Colleague

**V61** To Talk with Colleagues about Family Matters

**V62** Make Jam

**V63** Frquently Ask Colleagues Questions

**V64** Decorate the Office with Flowers

**V65** Pick up the Dinner Bill

**V66** Shop for the Family

**V67** Have Problem using Technical Devices

**V68** Care for Family Besides a Job

**V69** Watch Action Movies

**V70** Cook

**V71** Help your Partner Put on His or Her Coat

**V72** Wash Windows

**V73** Do the Ironing

**V74** Do the Laundry

**V75** Put on Make-up

**V76** Femininity Scale

**V77** Masculinity Scale

**V78** Femininity Scale

**V79** Masculinity Scale

**V80** Pooled Scale

**MMINUS1 - MPLUS** see the original Athenstaedt paper

FBEHAV a numeric vector

MBEHAV a numeric vector

Femininity a numeric vector

Masculinity a numeric vector

MF a numeric vector

## Details

Ursala Athenstaedt (2003) reported several analyses of items and scales measuring Gender Role Self-Concept. Eagly and Revelle (2022) have used these data in an analysis of the power of aggregation. Here are the original items as well as the three scales Eagly and Revelle (2022). The accompanying Athenstaedt.dictionary may be used to see the items.

See the GERAS data set for a related example.

## Source

Ursala Athenstaedt, personal communication, 2022, provided a SPSS sav file with the original data from which the complete cases in this set were selected.

```

---

bfi                         *25 Personality items representing 5 factors*

---

## Description

25 personality self report items taken from the International Personality Item Pool (ipip.ori.org) were included as part of the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project. The data from 2800 subjects are included here as a demonstration set for scale construction, factor analysis, and Item Response Theory analysis. Three additional demographic variables (sex, education, and age) are also included.

## Usage

```
data(bfi)
data(bfi.dictionary)
```

## Format

A data frame with 2800 observations on the following 28 variables. (The q numbers are the SAPA item numbers).

A1  Am indifferent to the feelings of others. (q_146)

A2  Inquire about others' well-being. (q_1162)

A3  Know how to comfort others. (q_1206)

A4  Love children. (q_1364)

A5  Make people feel at ease. (q_1419)

C1  Am exacting in my work. (q_124)

C2  Continue until everything is perfect. (q_530)

C3  Do things according to a plan. (q_619)

C4  Do things in a half-way manner. (q_626)

C5  Waste my time. (q_1949)

E1  Don't talk a lot. (q_712)

E2 Find it difficult to approach others. (q_901)

E3 Know how to captivate people. (q_1205)

E4 Make friends easily. (q_1410)

E5 Take charge. (q_1768)

N1 Get angry easily. (q_952)

N2 Get irritated easily. (q_974)

N3 Have frequent mood swings. (q_1099

N4 Often feel blue. (q_1479)

N5 Panic easily. (q_1505)

O1 Am full of ideas. (q_128)

O2 Avoid difficult reading material.(q_316)

O3 Carry the conversation to a higher level. (q_492)

O4 Spend time reflecting on things. (q_1738)

O5 Will not probe deeply into a subject. (q_1964)

gender  Males = 1, Females =2

education  1 = HS, 2 = finished HS, 3 = some college, 4 = college graduate 5 = graduate degree

age  age in years

### Details

The first 25 items are organized by five putative factors: Agreeableness, Conscientiousness, Extraversion, Neuroticism, and Opennness. The scoring key is created using make.keys, the scores are found using score.items.

These five factors are a useful example of using irt.fa to do Item Response Theory based latent factor analysis\ of the polychoric correlation matrix. The endorsement plots for each item, as well as the item information functions reveal that the items differ in their quality.

The item data were collected using a 6 point response scale: 1 Very Inaccurate 2 Moderately Inaccurate 3 Slightly Inaccurate 4 Slightly Accurate 5 Moderately Accurate 6 Very Accurate

as part of the Synthetic Apeture Personality Assessment (SAPA https://www.sapa-project.org/) project. To see an example of the data collection technique, visit https://www.SAPA-project.org/ or the International Cognitive Ability Resource at https://icar-project.org. The items given were sampled from the International Personality Item Pool of Lewis Goldberg using the sampling technique of SAPA. This is a sample data set taken from the much larger SAPA data bank.

### Note

The bfi data set and items should not be confused with the BFI (Big Five Inventory) of Oliver John and colleagues (John, O. P., Donahue, E. M., & Kentle, R. L. (1991). The Big Five Inventory–Versions 4a and 54. Berkeley, CA: University of California,Berkeley, Institute of Personality and Social Research.)

### Source

The items are from the ipip (Goldberg, 1999). The data are from the SAPA project (Revelle, Wilt and Rosenthal, 2010) , collected Spring, 2010 ( https://www.sapa-project.org/).

extraversion=c("-E1","-E2","E3","E4","E5"),neuroticism=c("N1","N2","N3","N4","N5"),
openness = c("O1","-O2","O3","O4","-O5"))

 scores <- psych::scoreItems(bfi.keys,bfi,min=1,max=6) #specify the minimum and maximum values
 scores
 #show the use of the keys.lookup with a dictionary
 psych::keys.lookup(bfi.keys,bfi.dictionary[,1:4])
```

---

BFI.adjectives.dictionary

*Dictionary for the 100 Big Five Adjectives*

---

**Description**

Lew Goldberg organized 100 adjectives to measure 5 factors of personality (The Big5). 500 hundred participants were given these adjectives along with other personality measures. This dictionary allows for easy item labeling of the results. ~

**Usage**

```
data("BFI.adjectives.dictionary")
```

## Format

A data frame with 100 observations on the following 2 variables.

numer  a character vector of the item label

Item  a character vector of the actual adjectives

## Details

Keying information for the 100 adjectives:

## Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

## References

```

---

`big5.100.adjectives`    *100 adjectives describing the "big 5" for 502 subjects*

---

### Description

Lew Goldberg organized 100 adjectives to measure 5 factors of personality (The Big5). 554 participants were given these adjectives along with other personality measures in the Personality, Motivation and Cognition (PMC) lab. This data set is for demonstrations of factor and cluster analysis.

### Usage

```
data("big5.100.adjectives")
```

### Format

A data frame with 554 observations on the following 102 variables.

study  a character vector

id  a numeric vector

V1  numeric vector (see bfi.adjectives.dictionary)

V100  A numeric vector. (see bfi.adjectives.dictionary)

**bfi.adjectives.keys**  a key list

### Details

Procedure. The data were collected over nine years in the Personality, Motivation and Cognition laboratory at Northwestern, as part of a series of studies examining the effects of personality and situational factors on motivational state and subsequent cognitive performance. In each of 38 studies, prior to any manipulation of motivational state, participants signed a consent form and in some studies, consumed 0 or 4mg/kg of caffeine. In caffeine studies, they waited 30 minutes and then filled out the MSQ as well as other personality trait measures (e.g. the Big 5 adjectives)

### Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

```

---

blant                          *A 29 x 29 matrix that produces weird factor analytic results*

---

## Description

Normally, min.res factor analysis and maximum likelihood produce very similar results. This data set (from Alexandra Blant) does not. Warnings are given for the min.res solution, the pa solution, but not the old.min nor the mle solution. Included as a test case for the factor analysis function.

## Usage

```
data("blant")
```

## Format

The format is: num [1:29, 1:29] 1 0.77 0.813 0.68 0.717 ... - attr(*, "dimnames")=List of 2 ..$ : NULL ..$ : chr [1:29] "V1" "V2" "V3" "V4" ...

## Details

This data matrix was sent by Alexandra Blant as an example of a problem with the minres solution in the [fa](#) function. The default solution, using fm="minres" issues a warning that the solution has improper factor score weights. This is not the case for the fm="old.min" and fm="mle" options, but is for fm="pa", fm="ols".

The residuals are indeed smaller for fm="minres" than for fm="old.min" or fm="mle".

"old.min" attempts to find the minimum residual but uses the gradient for mle. This was the approach until version 1.7.5 but was changed (see the help page for fa) following extensive communication with Hao Wu.

The problem with this matrix is probably that it is almost singular, with some smcs approaching 1 and the smallest three eigenvalues of .006, .004 and .001.

This problem matrix was provided by Alexandra Blant.

## Source

Alexandra Blant, personal communication

## Examples

```
data(blant)
#compare
f5 <- psych::fa(blant,5,rotate="none")  #the default minres
f5.old <- psych::fa(blant,5, fm="old.min",rotate="none") #old version of minres
f5.mle <- psych::fa(blant,5,fm="mle",rotate= "none") #maximum likelihood
#compare solutions
psych::factor.congruence(list(f5,f5.old,f5.mle))
#compare sums of squared residuals
sum(residuals(f5,diag=FALSE)^2,na.rm=TRUE) # 1.355489
sum(residuals(f5.old,diag=FALSE)^2,na.rm=TRUE) # 1.539757
sum(residuals(f5.mle,diag=FALSE)^2,na.rm=TRUE) # 2.402092

#but, when we divide the squared residuals by the original (squared) correlations, we find
#a different ordering of fit
f5$fit     # 0.9748177

blot                          *Bond's Logical Operations Test – BLOT*

---

## Description

35 items for 150 subjects from Bond's Logical Operations Test. A good example of Item Response Theory analysis using the Rasch model. One parameter (Rasch) analysis and two parameter IRT analyses produce somewhat different results.

## Usage

```
data(blot)
```

## Format

A data frame with 150 observations on 35 variables. The BLOT was developed as a paper and pencil test for children to measure Logical Thinking as discussed by Piaget and Inhelder.

## Details

Bond and Fox apply Rasch modeling to a variety of data sets. This one, Bond's Logical Operations Test, is used as an example of Rasch modeling for dichotomous items. In their text (p 56), Bond and Fox report the results using WINSTEPS. Those results are consistent (up to a scaling parameter) with those found by the rasch function in the ltm package. The WINSTEPS seem to produce difficulty estimates with a mean item difficulty of 0, whereas rasch from ltm has a mean difficulty of -1.52. In addition, rasch seems to reverse the signs of the difficulty estimates when reporting the coefficients and is effectively reporting "easiness".

However, when using a two parameter model, one of the items (V12) behaves very differently.

This data set is useful when comparing 1PL, 2PL and 2PN IRT models.

## Source

The data are taken (with kind permission from Trevor Bond) from the webpage https://www.winsteps.com/BF3/bondfox3.htm and read using read.fwf.

## Examples

```
data(blot)

 #ltm is not required by psychTools, but if available, may be run to show a Rasch model

#do the same thing with functions in psych
blot.fa <- psych::irt.fa(blot)  # a 2PN model
plot(blot.fa)
```

---

burt                     *11 emotional variables from Burt (1915)*

---

## Description

Cyril Burt reported an early factor analysis with a circumplex structure of 11 emotional variables in 1915. 8 of these were subsequently used by Harman in his text on factor analysis. Unfortunately, it seems as if Burt made a mistake for the matrix is not positive definite. With one change from .87 to .81 the matrix is positive definite.

## Usage

```
data(burt)
```

## Format

A correlation matrix based upon 172 "normal school age children aged 9-12".

**Sociality** Sociality

**Sorrow** Sorrow

**Tenderness** Tenderness

**Joy** Joy

**Wonder** Wonder

**Elation** Elation

**Disgust** Disgust

**Anger** Anger

**Sex** Sex

**Fear** Fear

**Subjection** Subjection

## Details

The Burt data set is interesting for several reasons. It seems to be an early example of the orga-
nizaton of emotions into an affective circumplex, a subset of it has been used for factor analysis
examples (see Harman.Burt, and it is an example of how typos affect data. The original data matrix
has one negative eigenvalue. With the replacement of the correlation between Sorrow and Tender-
ness from .87 to .81, the matrix is positive definite.

Alternatively, using cor.smooth, the matrix can be made positive definite as well, although cor.smooth
makes more (but smaller) changes.

cities                           *Distances between 11 US cities*

---

## Description

Airline distances between 11 US cities may be used as an example for multidimensional scaling or cluster analysis.

## Usage

```
data(cities)
```

## Format

A data frame with 11 observations on the following 11 variables.

ATL   Atlana, Georgia

BOS   Boston, Massachusetts

ORD   Chicago, Illinois

DCA   Washington, District of Columbia

DEN   Denver, Colorado

LAX   Los Angeles, California

MIA   Miami, Florida

JFK   New York, New York

SEA   Seattle, Washington

SFO   San Francisco, California

MSY   New Orleans, Lousianna

## Details

An 11 x11 matrix of distances between major US airports. This is a useful demonstration of multiple dimensional scaling.

city.location is a dataframe of longitude and latitude for those cities.

Note that the 2 dimensional MDS solution does not perfectly capture the data from these city distances. Boston, New York and Washington, D.C. are located slightly too far west, and Seattle and LA are slightly too far south.

## Source

https://www.timeanddate.com/worldclock/distance.html

## Examples

```
data(cities)
city.location[,1] <- -city.location[,1] #included in the cities data set
plot(city.location, xlab="Dimension 1", ylab="Dimension 2",
   main ="Multidimensional scaling of US cities")
#do the mds
city.loc <- cmdscale(cities, k=2) #ask for a 2 dimensional solution  round(city.loc,0)
city.loc <- -city.loc  #flip the axes
 city.loc <- psych::rescale(city.loc,apply(city.location,2,mean),apply(city.location,2,sd))
points(city.loc,type="n") #add the date point to the map
text(city.loc,labels=names(cities))

## Not run:    #we need the maps package to be available
#an overlay map can be added if the package maps is available
if(require(maps)) {
  map("usa",add=TRUE)
}

## End(Not run)
```

| colom | *Correlations of 14 ability tests from the Spanish version of the WAIS (taken from Colom et al. 2002.)* |
| --- | --- |

---

## Description

Colom et al. analyze 14 tests from the Spanish version of the WAIS. This is a nice example of a hierarchical structure using the omega function. Here are the correlation matrices of the variables (colom), for 4 levels of education.

## Usage

```
data("colom")
 data("colom.ed0")
 data("colom.ed1")
 data("colom.ed2")
 data("colom.ed3")
```

## Format

The format is: num [1:14, 1:14] 1 0.755 0.608 0.555 0.715 0.729 0.627 0.616 0.606 0.598 ... - attr(*, "dimnames")=List of 2 ..$ : chr [1:14] "Vocabulary" "Similarities" "Arithmetic" "Digit_span" ... ..$ : chr [1:14] "Vocabulary" "Similarities" "Arithmetic" "Digit_span" ...

## Details

The Wechsler Adult Intelligence Scale (WAIS) is the "gold standard" measure of intelligence. Here is an example of the correlational structure of 14 tests. It was used by Colom and his colleagues to find correlations of WAIS scores as a function of education. Here we show the complete standardization sample.

The colom data set is the complete correlation matrix for all subjects (703 females, 666 males). The four subset data sets for four levels of education. Ns = 301, 432, 525, and 111.

```

---

cubits                    *Galton's example of the relationship between height and 'cubit' or forearm length*

---

## Description

Francis Galton introduced the 'co-relation' in 1888 with a paper discussing how to measure the relationship between two variables. His primary example was the relationship between height and forearm length. The data table (cubits) is taken from Galton (1888). Unfortunately, there seem to be some errors in the original data table in that the marginal totals do not match the table.

The data frame, heights, is converted from this table.

## Usage

```
data(cubits)
```

## Format

A data frame with 9 observations on the following 8 variables.

16.5 Cubit length < 16.5

16.75 16.5 <= Cubit length < 17.0

17.25 17.0 <= Cubit length < 17.5

17.75  17.5 <= Cubit length < 18.0
18.25  18.0 <= Cubit length < 18.5
18.75  18.5 <= Cubit length < 19.0
19.25  19.0 <= Cubit length < 19.5
19.75  19.5 <= Cubit length

### Details

Sir Francis Galton (1888) published the first demonstration of the correlation coefficient. The regression (or reversion to mediocrity) of the height to the length of the left forearm (a cubit) was found to .8. There seem to be some errors in the table as published in that the row sums do not agree with the actual row sums. These data are used to create a matrix using [table2matrix](#) for demonstrations of analysis and displays of the data.

cushny                          *A data set from Cushny and Peebles (1905) on the effect of three drugs on hours of sleep, used by Student (1908)*

---

### Description

The classic data set used by Gossett (publishing as Student) for the introduction of the t-test. The design was a within subjects study with hours of sleep in a control condition compared to those in 3 drug conditions. Drug1 was 06mg of L Hscyamine, Drug 2L and Drug2R were said to be .6 mg of Left and Right isomers of Hyoscine. As discussed by Zabell (2008) these were not optical isomers. The detal1, delta2L and delta2R are changes from the baseline control.

## Usage

```
data(cushny)
```

## Format

A data frame with 10 observations on the following 7 variables.

Control  Hours of sleep in a control condition

drug1  Hours of sleep in Drug condition 1

drug2L  Hours of sleep in Drug condition 2

drug2R  Hours of sleep in Drug condition 3 (an isomer of the drug in condition 2

delta1  Change from control, drug 1

delta2L  Change from control, drug 2L

delta2R  Change from control, drug 2R

## Details

The original analysis by Student is used as an example for the t-test function, both as a paired t-test and a two group t-test. The data are also useful for a repeated measures analysis of variance.

df2latex                        *Convert a data frame, correlation matrix, or factor analysis output to*
                                *a LaTeX or rtf table*

---

**Description**

A set of handy helper functions to convert data frames or matrices to LaTeX or rtf tables. Although
Sweave is the preferred means of converting R output to LaTeX, it is sometimes useful to go directly
from a data.frame or matrix to a LaTeX table. cor2latex will find the correlations and then create a
lower (or upper) triangular matrix for latex output. cor2rtf will do the same for rtf output. fa2latex
and fa2rtf will create the latex commands for showing the loadings and factor intercorrelations. As
the default option, tables are prepared in an approximation of APA format.

**Usage**

```
df2latex(x,digits=2,rowlabels=TRUE,apa=TRUE,short.names=TRUE,font.size ="scriptsize",
      big.mark=NULL,drop.na=TRUE, heading="A table from the psych package in R",
   caption="df2latex",label="default", char=FALSE,
   stars=FALSE,silent=FALSE,file=NULL,append=FALSE,cut=0,big=0,abbrev=NULL,long=FALSE)
cor2latex(x,use = "pairwise", method="pearson", adjust="holm",stars=FALSE,
      digits=2,rowlabels=TRUE,lower=TRUE,apa=TRUE,short.names=TRUE,
   font.size ="scriptsize", heading="A correlation table from the psych package in R.",
    caption="cor2latex",label="default",silent=FALSE,file=NULL,append=FALSE,cut=0,big=0)
fa2latex(f,digits=2,rowlabels=TRUE,apa=TRUE,short.names=FALSE,cumvar=FALSE,
      cut=0,big=.3,alpha=.05,font.size ="scriptsize",long=FALSE,
      heading="A factor analysis table from the psych package in R",
      caption="fa2latex",label="default",silent=FALSE,file=NULL,append=FALSE)
omega2latex(f,digits=2,rowlabels=TRUE,apa=TRUE,short.names=FALSE,cumvar=FALSE,cut=.2,
       big=.3,font.size ="scriptsize",
       heading="An omega analysis table from the psych package in R",
    caption="omega2latex",label="default",silent=FALSE,file=NULL,append=FALSE)

irt2latex(f,digits=2,rowlabels=TRUE,apa=TRUE,short.names=FALSE,
      font.size ="scriptsize", heading="An IRT factor analysis table from R",
      caption="fa2latex",label="default",silent=FALSE,file=NULL,append=FALSE)
ICC2latex(icc,digits=2,rowlabels=TRUE,apa=TRUE,ci=TRUE,
   font.size ="scriptsize",big.mark=NULL, drop.na=TRUE,
    heading="A table from the psych package in R",
  caption="ICC2latex",label="default",char=FALSE,silent=FALSE,file=NULL,append=FALSE)

#not all options are yet implemented in these next three functions.
df2rtf(x,file=NULL, digits=2,rowlabels=TRUE,width=8.5,old=NULL, apa=TRUE,short.names=TRUE,
font.size =10,big.mark=NULL, drop.na=TRUE,
heading="A table from the psych package in R",
caption="Created with df2rtf",label="default",char=FALSE,stars=FALSE,silent=FALSE,
append=FALSE,cut=0,big=.0,abbrev=NULL,long=FALSE)
```

```
cor2rtf(x,file=NULL, use = "pairwise", method="pearson", adjust="holm", digits=2,
rowlabels=TRUE,width=8.5,lower=TRUE,old=NULL, apa=TRUE,short.names=TRUE,
font.size =10,big.mark=NULL, drop.na=TRUE,
heading="A correlation matrix from the psych package in R",
caption="Created with cor2rtf.   left justify output if stars",
label="default",char=FALSE,stars=FALSE,silent=FALSE,
append=FALSE,cut=0,big=.0,abbrev=NULL,long=FALSE)

fa2rtf(f,file=NULL, use = "pairwise", method="pearson", adjust="holm", digits=2,
rowlabels=TRUE,width=8.5,lower=TRUE,old=NULL, apa=TRUE,short.names=TRUE,
font.size =10,big.mark=NULL, drop.na=TRUE,
heading="A Factor analysis   from the psych package in R",
caption="Created with fa2rtf. ",label="default",char=FALSE,silent=FALSE,
append=FALSE,cut=0,big=.0,abbrev=NULL)
```

## Arguments

| | |
|---|---|
| x | A data frame or matrix to convert to LaTeX. If non-square, then correlations will be found prior to printing in cor2latex |
| digits | Round the output to digits of accuracy. NULL for formatting character data |
| abbrev | How many characters should be used in column names –defaults to digits + 3 |
| rowlabels | If TRUE, use the row names from the matrix or data.frame |
| short.names | Name the columns with abbreviated rownames to save space |
| apa | If TRUE formats table in APA style |
| cumvar | For factor analyses, should we show the cumulative variance accounted for? |
| font.size | e.g., "scriptsize", "tiny" or anyother acceptable LaTeX font size. |
| heading | The label appearing at the top of the table |
| caption | The table caption |
| lower | in cor2latex, just show the lower triangular matrix |
| f | The object returned from a factor analysis using [fa](#) or [irt.fa](#). |
| label | The label for the table |
| big.mark | Comma separate numbers large numbers (big.mark=",") |
| drop.na | Do not print NA values |
| method | When finding correlations, which method should be used (pearson) |
| use | use="pairwise" is the default when finding correlations in cor2latex |
| adjust | If showing probabilities, which adjustment should be used (holm) |
| stars | Should probability 'magic astericks' be displayed in cor2latex (FALSE) |
| char | char=TRUE allows printing tables with character information, but does not allow for putting in commas into numbers |
| cut | In omega2latex, df2latex and fa2latex, do not print abs(values) < cut |
| big | In fa2latex and df2latex boldface those abs(values) > big |

| alpha | If fa has returned confidence intervals, then what values of loadings should be boldfaced? |
|---|---|
| icc | Either the output of an ICC, or the data to be analyzed. |
| ci | Should confidence intervals of the ICC be displayed |
| silent | If TRUE, do not print any output, just return silently – useful if using Sweave |
| file | If specified, write the output to this file |
| append | If file is specified, then should we append (append=TRUE) or just write to the file |
| long | if TRUE, then do long tables. (requires the longtable package in latex) |
| old | When appending output with df2rtf, old is the output from the prior run. |
| width | page width in inches for df2rtf |

## Value

A LaTeX table. Note that if showing "stars" for correlations, then one needs to use the siunitx package in LaTex. The entire LaTeX output is also returned invisibly. If using Sweave to create tables, then the silent option should be set to TRUE and the returned object saved as a file. See the last example.

Finally, some users have asked for the ability to convert these output tables into HTML. This may be done using the tth package.

Three functions to write to rtf files (for use in various proprietary word processing languages) have been added with version 2.4.3. These will write to an rtf file and may be formatted directly. df2rtf takes a data frame and writes it as a table with header information.

cor2rtf will take either a data matrix (and find the correlations) or just a correlation matrix. "magic astericks " can be added to the correlations using the stars=TRUE option. In this case, the result table can be left justified in a word processing language to get the numbers to appear correctly justified.

fa2latex and fa2rtf can take the output from either a factor analysis or from fa.lookup.

## Author(s)

William Revelle with suggestions from Jason French and David Condon and Davide Morselli

## See Also

The many LaTeX conversion routines in Hmisc.

To convert these LaTex objects to HTML, you should install the tth package.

Consider the last example for creating HTML

## Examples

```
df2latex(psych::Thurstone,rowlabels=FALSE,apa=FALSE,short.names=FALSE,
        caption="Thurstone Correlation matrix")
df2latex(psych::Thurstone,heading="Thurstone Correlation matrix in APA style")
```

```
df2latex(psych::describe(psych::sat.act)[2:10],short.names=FALSE)
cor2latex(psych::Thurstone)
cor2latex(psych::sat.act,short.names=FALSE)
fa2latex(psych::fa(psych::Thurstone,3),heading="Factor analysis from R in quasi APA style")

#to write to rtf file
#replace the temporary file name with something more useful
fn <- tempfile(pattern="example",fileext=".rtf")  #create a temporary file
#better is to create a local file
# e.g. fn <- "rtf_example.rtf"

cor2rtf(sat.act, file=fn)    #write to the file

dd <- psych::describe(sat.act)
temp <- df2rtf(dd, file=fn, append=TRUE, width=12) #write and keep open
temp1 <-  cor2rtf(sat.act,old=temp,caption=date(), append=TRUE)  #use date as caption
cor2rtf(sat.act, old=temp1, stars=TRUE) #close the file
#now open this with your word processor and reformat with left justify

#now write a factor analysis output to an output file
# e.g. fn <- "rtf_example.rtf"
f5 <- psych::fa(bfi,5)
temp <- fa2rtf(f5, width=12, file=fn, append=TRUE)  #a normal fa output
fl <- psych::fa.lookup(f5, dictionary=bfi.dictionary)
fa2rtf(fl, old = temp)
##now open this with your word processor

#To convert these latex tables to HTML

#f3.lat <- fa2latex(psych::fa(psych::Thurstone,3),
#    heading="Factor analysis from R in quasi APA style")
#library(tth)
#f3.ht <- tth(f3.lat)
#print(as.data.frame(f3.ht),row.names=FALSE)

###

 #If using Sweave to create a LateX table as a separate file then set silent=TRUE
#e.g.,
#LaTex preamble
#....
#<<print=FALSE,echo=FALSE>>=
#f3 <- fa(Thurstone,3)
#fa2latex(f3,silent=TRUE,file='testoutput.tex')
#@
#
#\input{testoutput.tex}
```

dfOrder                    *Sort (order) a dataframe or matrix by multiple columns*

**Description**

Although order will order a vector, and it is possible to order several columns of a data.frame by specifying each column individually in the call to order, dfOrder will order a dataframe or matrix by as many columns as desired. The default is to sort by columns in lexicographic order. If the object is a correlation matrix, then the selected columns are sorted by the (abs) max value across the columns (similar to fa.lookup in psych). If object is a correlation matrix, rows and columns are sorted.

**Usage**

```
dfOrder(object, columns,absolute=FALSE,ascending=TRUE)
```

**Arguments**

| | |
|---|---|
| object | The data.frame or matrix to be sorted |
| columns | Column numbers or names to use for sorting. If positive, then they will be sorted in increasing order. If negative, then in decreasing order |
| absolute | If TRUE, then sort the absolute values |
| ascending | By default, order from smallest to largest. |

**Details**

This is just a simple helper function to reorder data.frames and correlation matrices. Originally developed to organize IRT output from the ltm package. It is a basic add on to the order function.

(Completely rewritten for version 1.8.1. and then again for 2.2.1 to allow sorting correlation matrices by numeric values.)

**Value**

The original data frame is now in sorted order. If the input is a correlation matrix, the output is sorted by rows and columns.

**Author(s)**

William Revelle

**See Also**

Other useful file manipulation functions include read.file to read in data from a file or read.clipboard from the clipboard, fileScan, filesList, filesInfo, and fileCreate

dfOrder code is used in the test.irt function to combine ltm and sim.irt output.

## Examples

```
#create a data frame and then sort it in lexicographic order
set.seed(42)
x <- matrix(sample(1:4,64,replace=TRUE),ncol=4)
dfOrder(x)  # sort by all columns
dfOrder(x,c(1,4))  #sort by the first and 4th column
x.df <- data.frame(x)
dfOrder(x.df,c(1,-2))  #sort by the first in increasing order,
   #the second in decreasing order

#now show sorting correlation matrices
r <- cor(sat.act,use="pairwise")
r.ord <- dfOrder(r,columns=c("education","ACT"),ascending=FALSE)
psych::corPlot(r.ord)
```

---

eminence                         *Eminence of 69 American Psychologists*

---

## Description

Marco Del Giudice criticized an earlier study by Simonton for using partial regression weights to estimate the importance of various predictors of rated eminence. This is a nice example of the (mis)interpretation of beta weights of highly correlated predictors.

## Usage

```
data("eminence")
```

## Format

A data frame with 69 observations on the following 9 variables.

name  a character vector

reputation  Log of rated reputation

birth.year  Year of birth

first.year  Year of first cited publicatin

last.year  Year of last cited publication

works  Log of number of publications

citations  Log of number of citations

composite  A composite index of publications

h  The 'h' index of citations

## Details

Simonton (1997, 2014) discusses various estimates of eminence among 69 psychologists born between 1842 and 1912 and reports that the regression weights are small and interprets this as meaning number of publications and citations are not very important. Del Giudice (2020) points out that citations and the number of publications are highly collinear and thus while their independent contributions are small, their joint effect is quite large (R= .69 ). These data are given here as an example of multiple correlation and partial correlation

## Source

Del Giudice (2020) links to a web page with the data.

epi                           *Eysenck Personality Inventory (EPI) data for 3570 participants*

---

## Description

The EPI is and has been a very frequently administered personality test with 57 measuring two broad dimensions, Extraversion-Introversion and Stability-Neuroticism, with an additional Lie scale. Developed by Eysenck and Eysenck, 1964. Eventually replaced with the EPQ which measures three broad dimensions. This data set represents 3570 observations collected in the early 1990s at the Personality, Motivation and Cognition lab at Northwestern. An additional data set (epiR) has test and retest information for 474 participants. The data are included here as demonstration of scale construction and test-retest reliability.

## Usage

```
data(epi)
data(epi.dictionary)
data(epiR)
```

**Format**

A data frame with 3570 observations on the following 57 variables.

id  The identification number within the study

time  First (group testing) or 2nd time (before a lab experiment) for the epiR data set.

study  Four lab based studies and their pretest data

## Details

The original data were collected in a group testing framework for screening participants for subsequent studies. The participants were enrolled in an introductory psychology class between Fall, 1991 and Spring, 1995.

The actual items may be found in the `epi.dictionary`.

The structure of the E scale has been shown by Rocklin and Revelle (1981) to have two subcomponents, Impulsivity and Sociability. These were subsequently used by Revelle, Humphreys, Simon and Gilliland (1980) to examine the relationship between personality, caffeine induced arousal, and cognitive performance.

The epiR data include the original group testing data and matched data for 474 participants collected several weeks later. This is useful for showing that internal consistency estimates (e.g. `alpha` or `omega`) can be low even though the test is stable across time. For more demonstrations of the distinction between immediate internal consistency and delayed test-retest reliability see the `msqR` and `sai` data sets and `testRetest`.

| epi.bfi | *13 personality scales from the Eysenck Personality Inventory and Big 5 inventory* |
|---|---|

---

## Description

A small data set of 5 scales from the Eysenck Personality Inventory, 5 from a Big 5 inventory, a Beck Depression Inventory, and State and Trait Anxiety measures. Used for demonstrations of correlations, regressions, graphic displays.

## Usage

```
data(epi.bfi)
```

## Format

A data frame with 231 observations on the following 13 variables.

epiE  EPI Extraversion

epiS  EPI Sociability (a subset of Extraversion items

epiImp  EPI Impulsivity (a subset of Extraversion items

epilie  EPI Lie scale

epiNeur  EPI neuroticism

bfagree  Big 5 inventory (from the IPIP) measure of Agreeableness

bfcon  Big 5 Conscientiousness

bfext  Big 5 Extraversion

bfneur  Big 5 Neuroticism

bfopen  Big 5 Openness

bdi  Beck Depression scale

traitanx  Trait Anxiety

stateanx  State Anxiety

## Details

Self report personality scales tend to measure the "Giant 2" of Extraversion and Neuroticism or the "Big 5" of Extraversion, Neuroticism, Agreeableness, Conscientiousness, and Openness. Here is a small data set from Northwestern University undergraduates with scores on the Eysenck Personality Inventory (EPI) and a Big 5 inventory taken from the International Personality Item Pool.

## Source

Data were collected at the Personality, Motivation, and Cognition Lab (PMCLab) at Northwestern by William Revelle)

| galton | *Galton's Mid parent child height data* |

### Description

Two of the earliest examples of the correlation coefficient were Francis Galton's data sets on the relationship between mid parent and child height and the similarity of parent generation peas with child peas. This is the data set for the Galton height.

### Usage

```
data(galton)
```

### Format

A data frame with 928 observations on the following 2 variables.

parent  Mid Parent heights (in inches)

child  Child Height

### Details

Female heights were adjusted by 1.08 to compensate for sex differences. (This was done in the original data set)

### Source

This is just the galton data set from UsingR, slightly rearranged.

### References

GERAS                          *Data from Gruber et al, 2020, Study 2: Gender Related Attributes*
                               *Survey*

---

## Description

Gruber et al. (2020) report on the psychometric properties of a multifaceted Gender Related Attributes Survey. Here are the data from their 3 domains (Personality, Cognition and Activities and Interests from their study 2. Eagly and Revelle (2022) include these data in their review of the power of aggregation. The data are included here as demonstrations of the `cohen.d` and `scatterHist` functions in the psych package and may be used to show the power of aggregation.

## Usage

```
data("GERAS")
#These other objects are included in the file
# data("GERAS.scales")
# data("GERAS.dictionary")
# data("GERAS.items")
# data("GERAS.keys")
```

## Format

A data frame with 471 observations on the following 51 variables (selected from the original 93) The code numbers are item numbers from the bigger set.

V15 reckless

V22 willing to take risks

V11 courageous

V6 a adventurous

V19 dominant

V14 controlling

V20 boastful

V21 rational

V23 analytical

V9 pragmatic

V44 to find an address for the first time

V45 to find a way again

V46 to understand equations

V50 to follow directions

V51 to understand equations

V53 day-to-day calculations

V48 to write a computer program

V69 paintball

V73 driving go-cart

V71 drinking beer

V68 watching action movies

V75 playing cards (poker)

V72 watching sports on TV

V67 doing certain sports (e.g. soccer, ...)

V74 Gym (weightlifting)

V27 warm-hearted

V28 loving

V29 caring

V26 compassionate

V32 delicate

V30 tender

V24 familiy-oriented

V40 anxious

V39 thin-skinned

V41 careful

V55 to explain foreign words

V58 to find the right words to express certain content

V59 synonyms for a word in order to avoid repetitions

V60 to phrase a text

V54 remembering events from your own life

V63 to notice small changes

V57 to remember names and faces

V89 shopping

V92 gossiping

V81   watching a romantic movie

V80   talking on the phone with a friend

V90   yoga

V83   rhythmic gymnastics

V84   going for a walk

V86   dancing

gender   gender (M=1 F=2)

### Details

These 50 items (+ gender) may be formed into scales using the GERAS.keys The first 10 items are Male Personality, the next 10 are Female Personality, then 7 and 7 M and F Cognition, then 8 and 8 M and F Activity items. The Pers, Cog and Act scales are formed from the M-F scales for the three domains. M and F are the composites of the Male and then the Female scales. MF.all is the composite of the M - F scales. See the GERAS.keys object for scoring directions.

"M.pers" "F.pers" "M.cog" "F.cog" "M.act" "F.act" "Pers" "Cog" "Act" "M" "F" "MF.all" "gender"

See the Athenstaedt data set for a related data set.

---

globalWarm                    *7 attitude items about Global Warming policy from Erik Nisbet*

---

### Description

Erik Nisbet reported the relationship between emotions, ideology, and party affiliation as predictors of attitudes towards government action on climate change. The data were used by Hayes (2013) in a discussion of regression. They are available as the glbwarm data set in the processR package. They are copied here for examples of mediation.

### Usage

```
data("globalWarm")
```

### Format

A data frame with 815 observations on the following 7 variables.

govact  Support for govermment action

posemot  Positive emotions about climate change

negemot  Negative emotions about climate change

ideology  Political ideology (Liberal to conservative)

age age

sex  female =0, male =1

partyid  Democratic =1, Independent =2, Republican =3

### Details

This data set is discussed as an example of regression in Hayes (2013) p 24 - 30 and elsewhere. It is a nice example of moderated regression. It was collected by Erik Nisbet (no citation) who studies communication and the media. E. Nisbet is currently on the faculty at Northwestern School of Communication.

### Source

The raw data are available from the processR package (Keon-Woong Moon, 2020) as the glbwarm data set as well as from Hayes' website. The data set is used by Hayes in several examples. Used here by kind permission of Erik Nisbet.

Although the processR package has been removed from CRAN, an earlier version had the data.

| hare | *Counting Hare votes (Ranked choice voting)* |
|------|----------------------------------------------|

---

## Description

Ranked Choice Voting may be counted using the Hare system. All voter choices are considered, the votes for the candidate with the lowest first choice votes are distributed to the remaining candidates. This procedure is repeated until the number to be selected is determined.

## Usage

```
hare(x, n = 1)
```

## Arguments

| | |
|---|---|
| x | A data frame or matrix of rank orders for candidates (columns) by voters (rows). |
| n | How many winners to report |

## Details

A short function to convert rank orders into preferences. Ranked Choice Voting is used by many small societies to choose officers.

A more elegant approach may be found in the vote package.

For more information, see the help pages for vote or "for a description of the single transferable vote system see https://imstat.org/elections/single-transferable-voting-system/. " from the vote help page.

## Value

A vector of the winning candidates and their votes.

## Author(s)

William Revelle

## Examples

```
##-Load the votes package and compare the results to hare.
#not run
```

---

heights                        *A data.frame of the Galton (1888) height and cubit data set.*

---

## Description

Francis Galton introduced the 'co-relation' in 1888 with a paper discussing how to measure the relationship between two variables. His primary example was the relationship between height and forearm length. The data table (cubits) is taken from Galton (1888). Unfortunately, there seem to be some errors in the original data table in that the marginal totals do not match the table.

The data frame, heights, is converted from this table using table2df.

## Usage

```
data(heights)
```

## Format

A data frame with 348 observations on the following 2 variables.

height  Height in inches

cubit  Forearm length in inches

## Details

Sir Francis Galton (1888) published the first demonstration of the correlation coefficient. The regression (or reversion to mediocrity) of the height to the length of the left forearm (a cubit) was found to be .8. The original table cubits is taken from Galton (1888). There seem to be some errors in the table as published in that the row sums do not agree with the actual row sums. These data are used to create a matrix using table2matrix for demonstrations of analysis and displays of the data.

holzinger.swineford    *The raw and transformed data from Holzinger and Swineford, 1939*

---

**Description**

A classic data set in psychometrics is that from Holzinger and Swineford (1939). A 4 and 5 factor solution to 24 of these variables problem is presented by Harman (1976), and 9 of these are used by the lavaan package. The two data sets were supplied by Keith Widaman.

**Usage**

```
data(holzinger.swineford)
     data(holzinger.raw)
     data(holzinger.dictionary)
```

**Format**

A data frame with 301 observations on the following 33 variables. Longer descriptions taken from Thompson, (1998).

case  a numeric vector

school  School Pasteur or Grant-White

grade  Grade (7 or 8)

female  male = 1, female = 2

ageyr  age in years

mo  months over year

agemo  Age in months

t01_visperc  Visual perception test from Spearman VPT Part I

t02_cubes  Cubes, Simplification of Brighams Spatial Relations Test

t03_frmbord  Paper formboard-Shapes that can be combined to form a target

t04_lozenges  Lozenges from Thorndike-Shapes flipped over then identify target

t05_geninfo  General Information Verbal Test

t06_paracomp  Paragraph Comprehension Test

t07_sentcomp  Sentence Completion Test

t08_wordclas  Word clasification-Which word not belong in set

t09_wordmean  Word Meaning Test

t10_addition  Speeded addition test

t11_code  Speeded codetest-Transform shapes into alpha with code

t12_countdot  Speeded counting of dots in shap

t13_sccaps  Speeded discrimation of straight and curved caps

t14_wordrecg  Memory of Target Words

t15_numbrecg  Memory of Target Numbers

t16_figrrecg  Memory of Target Shapes

t17_objnumb  Memory of object-Number association targets

t18_numbfig  Memory of number-Object association targets

t19_figword  Memory of figure-Word association target

t20_deduction  Deductive Math Ability

t21_numbpuzz  Math number puzzles

t22_probreas  Math word problem reasoning

t23_series  Completion of a Math Number Series

t24_woody  Woody-McCall mixed math fundamentals test

t25_frmbord2  Revision of t3-Paper form board

t26_flags  Flags-possible substitute for t4 lozenges

**Details**

The following commentary was provided by Keith Widaman:

"The Holzinger and Swineford (1939) data have been used as a model data set by many investigators. For example, Harman (1976) used the "24 Psychological Variables" example prominently in his authoritative text on multiple factor analysis, and the data presented under this rubric consisted of 24 of the variables from the Grant-White school (N = 145). Meredith (1964a, 1964b) used several variables from the Holzinger and Swineford study in his work on factorial invariance under selection. Joreskog (1971) based his work on multiple-group confirmatory factor analysis using the Holzinger and Swineford data, subsetting the data into four groups.

Rosseel, who developed the 'lavaan' package for R, included 9 of the manifest variables from Holzinger and Swineford (1939) as a "resident" data set when one downloads the 'lavaan' package. Several background variables are included in this "resident" data set in addition to 9 of the psychological tests (which are named x1 – x9 in the data set). When analyzing these data, I found the distributions of the variables (means, SDs) did not match the sample statistics from the original article. For example, in the "resident" data set in 'lavaan', scores on all manifest variables ranged between 0 and 10, sample means varied between 3 and 6, and sample SDs varied between 1.0 and 1.5. In the original data set, scores ranges were rather different across tests, with some variables having scores that ranged between 0 and 20, but other manifest variables having scores ranging from 50 to over 300 – with obvious attendant differences in sample means and SDs.

After a bit of snooping (i.e., data analysis), I discovered that the 9 variables in the "resident" data set in 'lavaan' had been rescored through ratio transformations. The ratio transformations involved dividing the raw score for each person on a given test by a particular constant for that test that transformed scores on the test to have the desired range.

I decided to perform transformations of all 26 variables so that two data sets could be available to interested researchers:"

holzinger.raw are the raws scores on all variables from Holzinger & Swineford (1939)

holzinger.swineford are rescaled scores on all variables from Holzinger & Swineford.

holzinger.dictionary is a list of the variable names in short and long form.

... Widaman continues:

"As several persons have noted, Harman (1976) used data only from the Grant-White school (N = 145) for his 24 Psychological Variables data set. In doing so, Harman replaced t03_frmbord and t04_lozenges with t25_frmbord2 and t26_flags, because the latter two tests were experimental tests that were designed to be more appropriate for this age level. This substitution is fine, as long as one analyzes data from only the Grant- White school. If one wishes to perform multiple-group analyses and uses school as a grouping variable (as Meredith, 1964a, 1964b, and Joreskog, 1971, did), then tests 25 and 26 should not be used."

"As have others, Gorsuch (1983) mentioned that analyses based on the raw data reported by Holzinger and Swineford (1939) will not produce statistics (means, SDs, correlations) that match precisely the values reported by Holzinger and Swineford or Harman (1976). Following Gorsuch, I have assumed that the raw data are correct. Applying factor analytic techniques to the raw data from the Grant-White school and to the summary data reported by Harman (1976) will produce slightly different results, but results that differ in only minor, unimportant details."

These data are interesting not just for the historical completeness of having the original data, but also as an example of suppressor variables. Age and grade are positively correlated, and scores are higher in the 8th grade than in the 7th grade. But age (particularly in months) is negatively correlated with many of the cognitive tasks, and when grade and age are both entered into regression, this negative correlation is enhanced. That is, although increasing grade increases cognitive performance, younger children in both grades do better than the older children.

### Note

As discussed by Widaman, the descriptive values reported in Harman (1967) (p 124) do not quite match the descriptive statistics in holzinger.raw. Further note that the correlation matrix and factor loadings are trivially different from the Harman.24 factor loadings in the GPA rotation package.

The purpose behind presenting both the raw and transformed data is to show that the fit statistics from factor analysis are identical for these two data sets.

The variables v1 ... v9 in the lavaan package correspond to tests 1, 2, 4, 6, 7, 9, 10, 12 and 13.

income                          *US family income from US census 2008*

---

### Description

US census data on family income from 2008

### Usage

```
data(income)
```

### Format

A data frame with 44 observations on the following 4 variables.

value  lower boundary of the income group

count  Number of families within that income group

mean  Mean of the category

prop  proportion of families

### Details

The distribution of income is a nice example of a log normal distribution. It is also an interesting example of the power of graphics. It is quite clear when graphing the data that income statistics are bunched to the nearest 5K. That is, there is a clear sawtooth pattern in the data.

The all.income set is interpolates intervening values for 100-150K, 150-200K and 200-250K

### Source

US Census: Table HINC-06. Income Distribution to $250,000 or More for Households: 2008

https://www.census.gov/hhes/www/cpstables/032009/hhinc/new06_000.htm

### Examples

```
data(income)
with(income[1:40,], plot(mean,prop, main="US family income for 2008",xlab="income",
        ylab="Proportion of families",xlim=c(0,100000)))
with (income[1:40,], points(lowess(mean,prop,f=.3),typ="l"))
psych::describe(income)

with(all.income, plot(mean,prop, main="US family income for 2008",xlab="income",
```

```
                ylab="Proportion of families",xlim=c(0,250000)))
   with (all.income[1:50,], points(lowess(mean,prop,f=.25),typ="l"))
```

---

iqitems                          *16 multiple choice IQ items*

---

### Description

16 multiple choice ability items taken from the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project. The data from 1525 subjects are included here as a demonstration set for scoring multiple choice inventories and doing basic item statistics. For more information on the development of an open source measure of cognitive ability, consult the readings available at the https://personality-project.org/.

### Usage

```
data(iqitems)
```

### Format

A data frame with 1525 observations on the following 16 variables. The number following the name is the item number from SAPA.

reason.4 Basic reasoning questions

reason.16 Basic reasoning question

reason.17 Basic reasoning question

reason.19 Basic reasoning question

letter.7 In the following alphanumeric series, what letter comes next?

letter.33 In the following alphanumeric series, what letter comes next?

letter.34 In the following alphanumeric series, what letter comes next

letter.58 In the following alphanumeric series, what letter comes next?

matrix.45 A matrix reasoning task

matrix.46 A matrix reasoning task

matrix.47 A matrix reasoning task

matrix.55 A matrix reasoning task

rotate.3 Spatial Rotation of type 1.2

rotate.4 Spatial Rotation of type 1.2

rotate.6 Spatial Rotation of type 1.1

rotate.8 Spatial Rotation of type 2.3

**Details**

16 items were sampled from 80 items given as part of the SAPA (https://www.sapa-project.org/) project (Revelle, Wilt and Rosenthal, 2009; Condon and Revelle, 2014) to develop online measures of ability. These 16 items reflect four lower order factors (verbal reasoning, letter series, matrix reasoning, and spatial rotations. These lower level factors all share a higher level factor ('g'). Similar data are available from the International Cognitive Abiity Resource at https://www.icar-project.org/ .

This data set and the associated data set (ability based upon scoring these multiple choice items and converting them to correct/incorrect may be used to demonstrate item response functions, tetrachoric correlations, or irt.fa as well as omega estimates of of reliability and hierarchical structure.

In addition, the data set is a good example of doing item analysis to examine the empirical response probabilities of each item alternative as a function of the underlying latent trait. When doing this, it appears that two of the matrix reasoning problems do not have monotonically increasing trace lines for the probability correct. At moderately high ability (theta = 1) there is a decrease in the probability correct from theta = 0 and theta = 2.

**Source**

The example data set is taken from the Synthetic Aperture Personality Assessment personality and ability test at https://www.sapa-project.org/. The data were collected with David Condon from 8/08/12 to 8/31/12.

| msq | *75 mood items from the Motivational State Questionnaire for 3896 participants* |
|---|---|

---

## Description

Emotions may be described either as discrete emotions or in dimensional terms. The Motivational State Questionnaire (MSQ) was developed to study emotions in laboratory and field settings. The data can be well described in terms of a two dimensional solution of energy vs tiredness and tension versus calmness. Additional items include what time of day the data were collected and a few personality questionnaire scores.

## Usage

```
data(msq)
```

## Format

A data frame with 3896 observations on the following 92 variables.

## Details

The Motivational States Questionnaire (MSQ) is composed of 72 items, which represent the full affective space (Revelle & Anderson, 1998). The MSQ consists of 20 items taken from the Activation-Deactivation Adjective Check List (Thayer, 1986), 18 from the Positive and Negative Affect Schedule (PANAS, Watson, Clark, & Tellegen, 1988) along with the items used by Larsen and Diener (1992). The response format was a four-point scale that corresponds to Russell and Carroll's (1999) "ambiguous–likely-unipolar format" and that asks the respondents to indicate their current standing ("at this moment") with the following rating scale:
0—————-1—————-2—————3
Not at all A little Moderately Very much

The original version of the MSQ included 70 items. Intermediate analyses (done with 1840 subjects) demonstrated a concentration of items in some sections of the two dimensional space, and a paucity of items in others. To begin correcting this, 3 items from redundantly measured sections (alone, kindly, scornful) were removed, and 5 new ones (anxious, cheerful, idle, inactive, and tranquil) were added. T hus, the correlation matrix is missing the correlations between items anxious, cheerful, idle, inactive, and tranquil with alone, kindly, and scornful.

Procedure. The data were collected over nine years, as part of a series of studies examining the effects of personality and situational factors on motivational state and subsequent cognitive performance. In each of 38 studies, prior to any manipulation of motivational state, participants signed a consent form and filled out the MSQ. (The procedures of the individual studies are irrelevant to this data set and could not affect the responses to the MSQ, since this instrument was completed before any further instructions or tasks). Some MSQ post test (after manipulations) is available in affect.

The EA and TA scales are from Thayer, the PA and NA scales are from Watson et al. (1988). Scales and items:

Energetic Arousal: active, energetic, vigorous, wakeful, wide.awake, full.of.pep, lively, -sleepy, -tired, - drowsy (ADACL)

Tense Arousal: Intense, Jittery, fearful, tense, clutched up, -quiet, -still, - placid, - calm, -at rest (ADACL)

Positive Affect: active, alert, attentive, determined, enthusiastic, excited, inspired, interested, proud, strong (PANAS)

Negative Affect: afraid, ashamed, distressed, guilty, hostile, irritable , jittery, nervous, scared, upset (PANAS)

The PA and NA scales can in turn can be thought of as having subscales: (See the PANAS-X) Fear: afraid, scared, nervous, jittery (not included frightened, shaky) Hostility: angry, hostile, irritable, (not included: scornful, disgusted, loathing guilt: ashamed, guilty, (not included: blameworthy, angry at self, disgusted with self, dissatisfied with self) sadness: alone, blue, lonely, sad, (not included: downhearted) joviality: cheerful, delighted, energetic, enthusiastic, excited, happy, lively, (not included: joyful) self-assurance: proud, strong, confident, (not included: bold, daring, fearless ) attentiveness: alert, attentive, determined (not included: concentrating)

The next set of circumplex scales were taken (I think) from Larsen and Diener (1992). High activation: active, aroused, surprised, intense, astonished Activated PA: elated, excited, enthusiastic, lively Unactivated NA : calm, serene, relaxed, at rest, content, at ease PA: happy, warmhearted, pleased, cheerful, delighted Low Activation: quiet, inactive, idle, still, tranquil Unactivated PA: dull, bored, sluggish, tired, drowsy NA: sad, blue, unhappy, gloomy, grouchy Activated NA: jittery, anxious, nervous, fearful, distressed.

Keys for these separate scales are shown in the examples.

In addition to the MSQ, there are 5 scales from the Eysenck Personality Inventory (Extraversion, Impulsivity, Sociability, Neuroticism, Lie). The Imp and Soc are subsets of the the total extraversion scale.

id  a numeric vector

form  msq versus msqR

study  a character vector of the experiment name

### Details

The Motivational States Questionnaire (MSQ) is composed of 75 items, which represent the full af-
fective space (Revelle & Anderson, 1998). The MSQ consists of 20 items taken from the Activation-
Deactivation Adjective Check List (Thayer, 1986), 18 from the Positive and Negative Affect Sched-
ule (PANAS, Watson, Clark, & Tellegen, 1988) along with the affective circumplex items used by
Larsen and Diener (1992). The response format was a four-point scale that corresponds to Russell
and Carroll's (1999) "ambiguous–likely-unipolar format" and that asks the respondents to indicate
their current standing ("at this moment") with the following rating scale:
0—————-1—————-2—————-3
Not at all A little Moderately Very much

The original version of the MSQ included 70 items. Intermediate analyses (done with 1840 subjects)
demonstrated a concentration of items in some sections of the two dimensional space, and a paucity
of items in others. To begin correcting this, 3 items from redundantly measured sections (alone,
kindly, scornful) were removed, and 5 new ones (anxious, cheerful, idle, inactive, and tranquil) were
added. Thus, the correlation matrix is missing the correlations between items anxious, cheerful,
idle, inactive, and tranquil with alone, kindly, and scornful.

2605 individuals took Form 1 version, 3806 the Form 2 version. 3032 people (1218 form 1, 1814
form 2) took the MSQ at least once. 2086 at least twice, 1112 three times, and 181 four times.

To see the relative frequencies by time and form, see the first example.

Procedure. The data were collected over nine years in the Personality, Motivation and Cognition
laboratory at Northwestern, as part of a series of studies examining the effects of personality and
situational factors on motivational state and subsequent cognitive performance. In each of 38 stud-
ies, prior to any manipulation of motivational state, participants signed a consent form and in some
studies, consumed 0 or 4mg/kg of caffeine. In caffeine studies, they waited 30 minutes and then
filled out the MSQ. (Normally, the procedures of the individual studies are irrelevant to this data
set and could not affect the responses to the MSQ at time 1, since this instrument was completed
before any further instructions or tasks. However, caffeine does have an effect.) The MSQ post test
following a movie manipulation) is available in affect as well as here.

The XRAY study crossed four movie conditions with caffeine. The first MSQ measures are showing
the effects of the movies and caffeine, but after an additional 30 minutes, the second MSQ seems
to mainly show the caffeine effects. The movies were 9 minute clips from 1) a BBC documentary
on British troops arriving at the Bergen-Belsen concentration camp (sad); 2) an early scene from

Halloween in which the heroine runs around shutting doors and windows (terror); 3) a documentary about lions on the Serengeti plain, and 4) the "birthday party" scene from Parenthood.

The FLAT study measured affect before, immediately after, and then after 30 minutes following a movie manipulation. See the `affect` data set.

To see which studies used which conditions, see the second and third examples.

The EA and TA scales are from Thayer, the PA and NA scales are from Watson et al. (1988). Scales and items:

Energetic Arousal: active, energetic, vigorous, wakeful, wide.awake, full.of.pep, lively, -sleepy, -tired, - drowsy (ADACL)

Tense Arousal: Intense, Jittery, fearful, tense, clutched up, -quiet, -still, - placid, - calm, -at rest (ADACL)

Positive Affect: active, alert, attentive, determined, enthusiastic, excited, inspired, interested, proud, strong (PANAS)

Negative Affect: afraid, ashamed, distressed, guilty, hostile, irritable , jittery, nervous, scared, upset (PANAS)

The PA and NA scales can in turn can be thought of as having subscales: (See the PANAS-X) Fear: afraid, scared, nervous, jittery (not included frightened, shaky) Hostility: angry, hostile, irritable, (not included: scornful, disgusted, loathing guilt: ashamed, guilty, (not included: blameworthy, angry at self, disgusted with self, dissatisfied with self) sadness: alone, blue, lonely, sad, (not included: downhearted) joviality: cheerful, delighted, energetic, enthusiastic, excited, happy, lively, (not included: joyful) self-assurance: proud, strong, confident, (not included: bold, daring, fearless ) attentiveness: alert, attentive, determined (not included: concentrating)

The next set of circumplex scales were taken from Larsen and Diener (1992). High activation: active, aroused, surprised, intense, astonished Activated PA: elated, excited, enthusiastic, lively Unactivated NA : calm, serene, relaxed, at rest, content, at ease PA: happy, warmhearted, pleased, cheerful, delighted Low Activation: quiet, inactive, idle, still, tranquil Unactivated PA: dull, bored, sluggish, tired, drowsy NA: sad, blue, unhappy, gloomy, grouchy Activated NA: jittery, anxious, nervous, fearful, distressed.

Keys for these separate scales are shown in the examples.

In addition to the MSQ, there are 5 scales from the Eysenck Personality Inventory (Extraversion, Impulsivity, Sociability, Neuroticism, Lie). The Imp and Soc are subsets of the the total extraversion scale based upon a reanalysis of the EPI by Rocklin and Revelle (1983). This information is in the `msq` data set as well.

## Note

In December, 2018 the caffeine, film and personality conditions were added. In the process of doing so, it was discovered that the EMIT data had been incorrectly entered. This has been fixed.

## Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

## Description

The NEO.PI.R is a widely used personality test to assess 5 broad factors (Neuroticism, Extraversion, Openness, Agreeableness and Conscientiousness) with six facet scales for each factor. The correlation matrix of the facets is reported in the NEO.PI.R manual for 1000 subjects.

## Usage

```
data(neo)
```

## Format

A data frame of a 30 x 30 correlation matrix with the following 30 variables.

**N1** Anxiety

**N2** AngryHostility

**N3** Depression

**N4** Self-Consciousness

**N5** Impulsiveness

**N6** Vulnerability

**E1** Warmth

**E2** Gregariousness

**E3** Assertiveness

**E4** Activity

**E5** Excitement-Seeking

**E6** PositiveEmotions

**O1** Fantasy

**O2** Aesthetics

**O3** Feelings

**O4** Ideas

**O5** Actions

**O6** Values

**A1** Trust

**A2** Straightforwardness

**A3** Altruism

**A4** Compliance

**A5** Modesty

**A6** Tender-Mindedness

**C1** Competence

**C2** Order

**C3** Dutifulness

**C4** AchievementStriving

**C5** Self-Discipline

**C6** Deliberation

### Details

The past thirty years of personality research has led to a general consensus on the identification of major dimensions of personality. Variously known as the "Big 5" or the "Five Factor Model", the general solution represents 5 broad domains of personal and interpersonal experience. Neuroticism and Extraversion are thought to reflect sensitivity to negative and positive cues from the environment and the tendency to withdraw or approach. Openness is sometimes labeled as Intellect and reflects an interest in new ideas and experiences. Agreeableness and Conscientiousness reflect tendencies to get along with others and to want to get ahead.

The factor structure of the NEO suggests five correlated factors as well as two higher level factors. The NEO was constructed with 6 "facets" for each of the five broad factors.

For a contrasting structure, examine the items of the link{spi} data set (Condon, 2017).

| peas | *Galton's Peas* |
|------|-----------------|

---

## Description

Francis Galton introduced the correlation coefficient with an analysis of the similarities of the parent and child generation of 700 sweet peas.

## Usage

```
data(peas)
```

## Format

A data frame with 700 observations on the following 2 variables.

parent The mean diameter of the mother pea for 700 peas

child The mean diameter of the daughter pea for 700 sweet peas

## Details

Galton's introduction of the correlation coefficient was perhaps the most important contribution to the study of individual differences. This data set allows a graphical analysis of the data set. There are two different graphic examples. One shows the regression lines for both relationships, the other finds the correlation as well.

Pollack                          *Pollack et al (2012) correlation matrix for mediation example*

---

## Description

A correlation matrix taken from Pollack (2012) with 9 variables. Primarily used as an example for setCor and mediation.

## Usage

```
data("Pollack")
```

## Format

A correlation matrix based upon 262 participants.

sex  Male = 1, Female = 0, 62% male

age  mean =33

tenure  length of employent, mean = 5.9 years

self.efficacy  self ratings

competence  self rating of competence

social.ties  Contact with business-related social ties

economic.stress  mean of two items on economic stress

depression  6 items from MAACL measuring depression

withdrawal  Withdrawal intentions in domain of entrepreneurship

## Details

This is the correlation matrix from Pollack et al. (2012) p 797. The raw data are available from the processR package (Keon-Woong Moon, 2020). The data set is used by Hayes in example p 179 in example 3.

psych::describe(ability)
```

---

rd2html                          *Convert all Rd files in a directory to HTML files in a new directory*

---

## Description

Just a wrapper for tools::RdHTML to find a directory (e.g., the Man directory of help files) and convert them to HTML files in a new directory. Useful for adding HTML help files to a local web page.

## Usage

```
rd2html(inDir =NULL,outDir=NULL, nfiles=NULL,package="psych",file=NULL)
```

## Arguments

| | |
|---|---|
| inDir | The input directory. If NULL,then a file in a directory will be searched for using file.choose() |
| outDir | Where to write the output files |
| nfiles | If not NULL, then how many files should be written |
| package | name of package |
| file | If specified, just convert this one file to HTML |

## Details

Just a wrapper for Rd2HTML calling some file tools. An interesting use of the function is to precheck whether all the help files are syntactically correct.

## Author(s)

William Revelle

## See Also

See Also as `filesList`, `filesInfo`

## Examples

#This is an  interactive function whic require interactive input and thus is not given as examples
rd2html()

}
```

---

read.file                         *Shortcuts for reading from the clipboard or a file*

---

## Description

Input from a variety of sources may be read. Matrices or data.frames may be read from files with suffixes of .txt, .text, .TXT, .dat, .DATA,.data, .csv, .rds, rda, .xpt, XPT, or .sav (i.e., data from SPSS sav files may be read as can files saved by SAS using the .xpt option). Data exported by JMP or EXCEL in the csv format are also able to be read. Fixed Width Files saved in .txt mode may be read if the widths parameter is specified. Files saved with writeRDS have suffixes of .rds or Rds, and are read using readRDS. Files associated with objects with suffixes .rda and .Rda are loaded (following a security prompt). The default values for read.spss are adjusted for more standard input from SPSS files. Input from the clipboard is easy but a bit obscure, particularly for Mac users. `read.clipboard` and its variations are just an easier way to do so. Data may be copied to the clipboard from Excel spreadsheets, csv files, or fixed width formatted files and then into a data.frame. Data may also be read from lower (or upper) triangular matrices and filled out to square matrices. Writing text files may be done using `write.file` which will prompt for a file name (if not given) and then write or save to that file depending upon the suffix (text, txt, or csv will call write.table, R, or r will dput, rda, Rda will save, Rds,rds will saveRDS).

## Usage

```
read.file(file=NULL,header=TRUE,use.value.labels=FALSE,to.data.frame=TRUE,sep=",",
    quote="\"", widths=NULL,f=NULL, filetype=NULL,...)
  #for .txt, .text, TXT, .csv, .sav, .xpt, XPT,  R, r, Rds, .rds, or .rda,
 # .Rda, .RData, .Rdata, .dat and .DAT  files
```

```
read.clipboard(header = TRUE, ...)   #assumes headers and tab or space delimited
read.clipboard.csv(header=TRUE,sep=',',...)  #assumes headers and comma delimited
read.clipboard.tab(header=TRUE,sep='\t',...)  #assumes headers and tab delimited
 #read in a matrix given the lower off diagonal
 read.clipboard.lower(diag=TRUE,names=FALSE,...)
 read.clipboard.upper(diag=TRUE,names=FALSE,...)

#read in data using a fixed format width (see read.fwf for instructions)
read.clipboard.fwf(header=FALSE,widths=rep(1,10),...)

read.https(filename,header=TRUE)
read.file.csv(file=NULL,header=TRUE,f=NULL,...)

#For output:
#be sure to specify the file type in name
write.file(x,file=NULL,row.names=FALSE,f=NULL,...)
write.file.csv(x,file=NULL,row.names=FALSE,f=NULL,...)
```

## Arguments

| | |
|---|---|
| header | Does the first row have variable labels (generally assumed to be TRUE). |
| sep | What is the designated separater between data fields? For typical csv files, this will be a comma, but if commas designate decimals, then a ; can be used to designate different records. |
| quote | Specified to |
| diag | for upper or lower triangular matrices, is the diagonal specified or not |
| names | for read.clipboard.lower or upper, are colnames in the the first column |
| widths | how wide are the columns in fixed width input. The default is to read 10 columns of size 1. |
| filename | Name or address of remote https file to read. |
| ... | Other parameters to pass to read |
| f | A file name to read from or write to. If omitted, `file.choose` is called to dynamically get the file name. |
| file | A file name to read from or write to. (same as f, but perhaps more intuitive). If omitted and if f is omitted,then `file.choose` is called to dynamically get the file name. |
| x | The data frame or matrix to write to f |
| row.names | Should the output file include the rownames? By default, no. |
| to.data.frame | Should the spss input be converted to a data frame? |
| use.value.labels | |
| | Should the SPSS input values be converted to numeric? |
| filetype | If specified the reading will use this term rather than the suffix. |

**Details**

A typical session of R might involve data stored in text files, generated online, etc. Although it is
easy to just read from a file (particularly if using read.file), an alternative is to use one's local sys-
tem to copy from the file to the clipboard and then read from the clipboard using read.clipboard.
This is very convenient (and somewhat more intuitive to the naive user). This is particularly useful
when copying from a text book or article and just moving a section of text into R. However, copying
from a file and then reading the clipboard is hard to automate in a script. Thus, read.file will read
from a file.

The read.file function combines the file.choose and either read.table, read.fwf, read.spss
or read.xport (from foreign) or load or readRDS commands. By examining the file suffix, it
chooses the appropriate way to read the file. For more complicated file structures, see the foreign
package. For even more complicated file structures, see the rio or haven packages.

Note that read.file assumes by default that the first row has column labels (header =TRUE). If
this is not true, then make sure to specify header = FALSE. If the file is fixed width, the assumption
is that it does not have a header field. In the unlikely case that a fwf file does have a header, then
you probably should try fn <- file.choose() and then my.data <- read.fwf(fn,header=TRUE,widths=
widths).

Further note: If the file is a .Rda, .rda, etc. file, the read.file command will return the name and
location of the file. It will prompt the user to load this file. In this case, it is necessary to either
assign the output (the file name) to an object that has a different name than any of the objects in the
file, or to call read.file() without any specification. Notice that loading an .Rda file can overwrite
existing objects. Thus the warning and the need to do the second step.

If the file has no suffix the default action is to quit with a warning. However, if the filetype is
specified, it will use that type in the reading (e.g. filetype="txt" will read as text file, even if there is
no suffix).

If the file is specified and has a prefix of http:// or https:// it will be downloaded and then read.

Currently supported input formats are

| | |
|---|---|
| .sav | SPSS.sav files |
| .csv | A comma separated file (e.g. from Excel or Qualtrics) |
| .txt | A typical text file |
| .TXT | A typical text file |
| .text | A typical text file |
| .data | A data file |
| .dat | A data file |
| .rds | A R data file |
| .Rds | A R data file (created by a write) |
| .Rda | A R data structure (created using save) |
| .rda | A R data structure (created using save) |
| .RData | A R data structure (created using save) |
| .rdata | A R data structure (created using save) |
| .R | A R data structure created using dput |
| .r | A R data structure created using dput |
| .xpt | A SAS data file in xport format |
| .XPT | A SAS data file in XPORT format |

Some data files have an extra ' in the data ( e.g. the NYT covid data base). These files can be read specifying quote ""

The foreign function read.spss is used to read SPSS .sav files using the most common options. Just as read.spss issues various warnings, so does read.file. In general, these can be ignored. For more detailed information about using read.spss, see the help pages in the foreign package.

If you have a file written by JMP, you must first export to a csv or text file.

The write.file function combines the file.choose and either write.table or saveRDS. By examining the file suffix, it chooses the appropriate way to write. For more complicated file structures, see the foreign package, or the save function in R Base. If no suffix is added, it will write as a .txt file. write.file.csv will write in csv format to an arbitrary file name.

Currently supported output formats are

| | |
|------|---|
| .csv | A comma separated file (e.g. for reading into Excel) |
| .txt | A typical text file |
| .text | A typical text file |
| .rds | A R data file |
| .Rds | A R data file (created by a write) |
| .Rda | A R data structure (created using save) |
| .rda | A R data structure (created using save) |
| .R | A R data structure created using dput |
| .r | A R data structure created using dput |

Many Excel based files specify missing values as a blank field. When reading from the clipboard, using read.clipboard.tab will change these blank fields to NA.

Sometimes missing values are specified as "." or "999", or some other values. These can be converted by the read.file command specifying what values are missing (e.g., na ="."). See the example for the reading from the remote mtcars.csv file.

read.clipboard was based upon a suggestion by Ken Knoblauch to the R-help listserve.

If the input file that was copied into the clipboard was an Excel file with blanks for missing data, then read.clipboard.tab() will correctly replace the blanks with NAs. Similarly for a csv file with blank entries, read.clipboard.csv will replace empty fields with NA.

read.clipboard.lower and read.clipboard.upper are adapted from John Fox's read.moments function in the sem package. They will read a lower (or upper) triangular matrix from the clipboard and return a full, symmetric matrix for use by factanal, fa , ICLUST, pca. omega , etc. If the diagonal is false, it will be replaced by 1.0s. These two function were added to allow easy reading of examples from various texts and manuscripts with just triangular output.

Many articles will report lower triangular matrices with variable labels in the first column. read.clipboard.lower will handle this case. Names must be in the first column if names=TRUE is specified.

Other articles will report upper triangular matrices with variable labels in the first row. read.clipboard.upper will handle this. Note that labels in the first column will not work for read.clipboard.upper. The names, if present, must be in the first row.

Consider the following lower triangular matrix. To read it, copy it to the clipboard and read.clipboard.lower(names=TRUE)

```
A1 1.00
 A2 -0.34 1.00
 A3 -0.27 0.49 1.00
 A4 -0.15 0.34 0.36 1.00
 A5 -0.18 0.39 0.50 0.31 1.00
 C1 0.03 0.09 0.10 0.09 0.12 1.00
```

However, if the data are strung out e.g.,

```
-.34
-.27
-.15
-.18
.03
.49
.34
.39
.09
.36
.50
.10
.31
.09
.12
```

Then one needs to read it using the read.clipboard.upper(names=FALSE,diag=FALSE) option.

read.clipboard.fwf will read fixed format files from the clipboard. It includes a patch to read.fwf which will not read from the clipboard or from remote file. See read.fwf for documentation of how to specify the widths.

### Value

The contents of the file to be read or of the clipboard. Saved as a data.frame.

### Author(s)

William Revelle

### Examples

```
#All of these functions are meant for interactive Input
#Because these are dynamic functions, they need to be run interactively and
# can not be run as examples.
#Thus they are not to be tested by CRAN

if(interactive()) {
 my.data <- read.file()  #search the directory for a file and then read it.
```

```
                          #return the result into an object
#or, if the file is a rda, etc. file
my.data <- read.file()  #return the path and instructions of how to load
  # without assigning a value.

filesList() #search the system for a particular file and then list all the files in that directory
fileCreate() #search for a particular directory and create a file there.
write.file(Thurstone) #open the search window, choose a location and name the output file,
# write the data file (e.g., Thurstone ) to the file chosen

#the example data set from read.delim in the readr package to read a remote csv file
my.data <-read.file(
"https://github.com/tidyverse/readr/raw/master/inst/extdata/mtcars.csv",
na=".")   #the na option is used for an example, but is not needed for these data

#These functions read from the local clipboard and thus are interactive
my.data <- read.clipboard()   #space delimited columns
my.data <- read.clipboard.csv()  # , delimited columns
my.data <- read.clipboard.tab()  #typical input if copied from a spreadsheet
my.data <- read.clipboad(header=FALSE)  #data start on line 1
my.matrix <- read.clipboard.lower()
}
```

---

| recode | *Recode or rearrange or reshape variables or values to new values* |
|--------|--------------------------------------------------------------------|

---

### Description

Given a set of numeric codes, change their values to different values given a mapping function. Also included are the ability to reorder columns or to convert wide sets of columns to long form

### Usage

```
rearrange(x,pattern)    #reorder the variables
wide2long(x,width, cname=NULL, idname = NULL, idvalues=NULL ,pattern=NULL)
recode(x, where, isvalue, newvalue)  #recode text values to numeric values
```

### Arguments

| | |
|---------|---------------------------------------------|
| x | A matrix or data frame of numeric values |
| where | The column numbers to fix |
| isvalue | A vector of values to change |
| newvalue | A vector of the new values |
| pattern | column order of repeating patterns |
| width | width of long format |

| cname | Variable names of long format |
|---|---|
| idname | Name of first column |
| idvalues | Values to fill first column |

## Details

Three functions for basic recoding are included.

recode: Sometime, data are entered as levels in an incorrect order. Once converted to numeric values, this can lead to confusion. recoding of the data to the correct order is straightforward, if tedious.

rearrange: Another tedious problem is when the output of one function needs to be arranged for better data handling in subsequent function. Specify a pattern of choosing the new columns.

wide2long: And then, having rearranged the data, perhaps convert the file to long format.

## Value

The reordered data

## Note

Although perhaps useful, the recode function is definitely ugly code. For smaller data sets, the results from char2numeric back to the original will not work. char2numeric works column wise and orders the data in each column.

## Author(s)

William Revelle

## See Also

mlArrange in the psych package for a more general version of wide2long

## Examples

```
x <- matrix(1:120,ncol=12)
new <- rearrange(x,pattern = c(1,4, 7,10))
new
long <- wide2long(x,width=3,pattern=c(1,4, 7,10))  #rearrange and then make wide

temp <- bfi[1:100,1:5]
isvalue <- 1:6
newvalue <- psych::cs(one,two,three,four,five,six)
newtemp <- recode(temp,1:5,isvalue,newvalue)
newtemp  #characters
temp.num <- psych::char2numeric(newtemp) #convert to numeric
temp.num  #notice the numerical values have changed
new.temp.num <- recode(temp.num, 1:5, isvalue=c(3,6,5,2,1,4), newvalue=1:6)
#note that because char2numeric works column wise, this will fail for small sets
```

---

sai                               *State Anxiety data from the PMC lab over multiple occasions.*

---

### Description

State Anxiety was measured two-three times in 11 studies at the Personality-Motivation-Cognition laboratory. Here are item responses for 11 studies (9 repeated twice, 2 repeated three times). In all studies, the first occasion was before a manipulation. In some studies, caffeine, or movies or incentives were then given to some of the participants before the second and third STAI was given. In addition, Trait measures are available and included in the tai data set (3032 subjects).

### Usage

```
data(sai)
data(tai)
data(sai.dictionary)
```

### Format

A data frame with 3032 unique observations on the following 23 variables.

id a numeric vector

study a factor with levels ages cart fast fiat film flat home pat rob salt shedshop xray

time 1=First, 2 = Second, 3=third administration

TOD TOD (time of day 1= 8:50-9:30 am,2 = 1=3 pm, 3= 7:-8pm

drug drug (placebo (0) vs. caffeine (1))

film film (1=Frontline (concentration camp), 2 = Halloween 3= National Geographic (control), 4-Parenthood (humor)

anxious anxious

at.ease at ease

calm calm

comfortable comfortable

confident confident

content content

high.strung high.strung

jittery jittery

joyful joyful

nervous nervous

pleasant pleasant

rattled over-excited and rattled

regretful regretful

```
relaxed relaxed

rested rested

secure secure

tense tense

upset upset

worried worried

worrying worrying
```

### Details

The standard experimental study at the Personality, Motivation and Cognition (PMC) laboratory (Revelle and Anderson, 1997) was to administer a number of personality trait and state measures (e.g. the epi, msq, msqR and sai) to participants before some experimental manipulation of arousal/effort/anxiety. Following the manipulation (with a 30 minute delay if giving caffeine/placebo), some performance task was given, followed once again by measures of state arousal/effort/anxiety.

Here are the item level data on the sai (state anxiety) and the tai (trait anxiety). Scores on these scales may be found using the scoring keys. The affect data set includes pre and post scores for two studies (flat and maps) which manipulated state by using four types of movies.

In addition to being useful for studies of motivational state, these studies provide examples of test-retest and alternate form reliabilities. Given that 10 items overlap with the msqR data, they also allow for a comparison of immediate duplication of items with 30 minute delays.

Studies CART, FAST, SHED, RAFT, and SHOP were either control groups, or did not experimentally vary arousal/effort/anxiety.

AGES, CITY, EMIT, RIM, SALT, and XRAY were caffeine manipulations between time 1 and 2 (RIM and VALE were repeated day 1 and day 2)

FIAT, FLAT, MAPS, MIXX, and THRU were 1 day studies with film manipulation between time 1 and time 2.

SAM1 and SAM2 were the first and second day of a two day study. The STAI was given once per day. MSQ not MSQR was given.

VALE and PAT were two day studies with the STAI given pre and post on both days

RIM was a two day study with the STAI and MSQ given once per day.

Usually, time of day 1 = 8:50-9am am, and 2 = 7:30 pm, however, in rob, with paid subjects, the times were 0530 and 22:30.

---

salary                           *Salary example from Cohen, Cohen, Aiken and West (2003)*

---

### Description

Four predictors of academic salary are used as examples in Cohen, Cohen, Aiken, and West (2003)
may be used for demonstration purposes of multiple regression and multiple correlation.

### Usage

```
data("salary")
```

### Format

A data frame with 62 observations on the following 5 variables.

time  Time since Ph.D.

publications  Number of publications

female  gender Male=0, Female =1

citations  Number of citations

salary  Salary

## Details

Two extended examples multiple regression in CCAW are discussed in Chapter 3.

These are nice examples of the use of the `link{psych::lmCor}` and `link{psych::partial.r}` functions.

Note that example data set in Table 3.2.1 (p 67) is just the first 15 cases of the complete data set used in Table 3.5.1 (page 81) and included in this data set.

sat.act                         *3 Measures of ability: SATV, SATQ, ACT*

---

## Description

Self reported scores on the SAT Verbal, SAT Quantitative and ACT were collected as part of the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project. Age, gender, and education are also reported. The data from 700 subjects are included here as a demonstration set for correlation and analysis.

## Usage

```
data(sat.act)
```

## Format

A data frame with 700 observations on the following 6 variables.

gender  males = 1, females = 2

education  self reported education 1 = high school ... 5 = graduate work

age  age

ACT  ACT composite scores may range from 1 - 36. National norms have a mean of 20.

SATV  SAT Verbal scores may range from 200 - 800.

SATQ  SAT Quantitative scores may range from 200 - 800

## Details

hese items were collected as part of the SAPA project (https://www.sapa-project.org/)to develop online measures of ability (Revelle, Wilt and Rosenthal, 2009). The score means are higher than national norms suggesting both self selection for people taking on line personality and ability tests and a self reporting bias in scores.

See also the iq.items data set.

Schutz                    *The Schutz correlation matrix example from Shapiro and ten Berge*

---

### Description

Shapiro and ten Berge use the Schutz correlation matrix as an example for Minimum Rank Factor Analysis. The Schutz data set is also a nice example of how normal minres or maximum likelihood will lead to a Heywood case, but minrank factoring will not.

### Usage

```
data("Schutz")
```

### Format

The format is: num [1:9, 1:9] 1 0.8 0.28 0.29 0.41 0.38 0.44 0.4 0.41 0.8 ... - attr(*, "dim-names")=List of 2 ..$ :1] "Word meaning" "Odd Words" "Boots" "Hatchets" ... ..$ : chr [1:9] "V1" "V2" "V3" "V4" ...

### Details

These are 9 cognitive variables of importance mainly because they are used as an example by Shapiro and ten Berge for their paper on Minimum Rank Factor Analysis.

The solution from the [fa](#) function with the fm='minrank' option is very close (but not exactly equal) to their solution.

This example is used to show problems with different methods of factoring. Of the various factoring methods, fm = "minres", "uls", or "mle" produce a Heywood case. Minrank, alpha, and pa do not.

See the blant data set for another example of differences across methods.

### References

Alexander Shapiro and Jos M.F. ten Berge (2002) Statistical inference of minimum rank factor analysis. Psychometrika, 67. 70-94

### Examples

```
data(Schutz)
psych::corPlot(Schutz,numbers=TRUE,upper=FALSE)

f4min <- psych::fa(Schutz,4,fm="minrank")  #for an example of minimum rank factor Analysis
#compare to
f4 <- psych::fa(Schutz,4,fm="mle") #for the maximum likelihood solution which has a Heywood case
```

---

| selectBy | *Select a subset of rows (subjects) meeting one or more criteria for columns* |
|---|---|

---

## Description

Select a subset of a data.frame or matrix for columns meeting specific criteria. Can do logical AND (default) or OR of the resulting search. Columns (variables) are specified by name and the conditions to meet include equality, less than, more than or inequality to a specified set of values. SplitBy creates new dichotomous variables based on the splitting criteria.

## Usage

```
selectBy(x, by)
splitBy(x, by, new=FALSE)
```

## Arguments

| | |
|---|---|
| x | A data frame or matrix |
| by | A quote delimited string of variables and criteria values. Multiple variables may be separated by commas (default to AND) |
| new | If true, return a new data frame with just the dichotomous variables otherwise concatenate the new variables to the right margin of x |

## Details

Two relatively trivial functions to help those less familiar with the subset function or how to use [] to select variables.

## Value

The subset of the original data.frame with just the cases that meet the criteria (selectBy) or new variables, recoded 0,1

selectBy is equivalent to subsetting x by an x value: small <- x[x[by=criterion]] or the subset function small <- subset(x, x$variable == value)

## Author(s)

William Revelle

## See Also

vJoin for another data manipulation function.

## Examples

```
testand <- selectBy(attitude, 'rating < 70 & complaints > 60')  #AND
dim(testand)
testor <- selectBy(attitude, 'rating < 60 | complaints > 60')  #OR
dim(testor)
test <- splitBy(attitude, 'rating > 70 , complaints > 60')
psych::headTail(test)
```

---

Spengler *Project Talent data set from Marion Spengler and Rodica Damian*

---

## Description

Project Talent gave 440,000 US high school students a number of personality and ability tests. Of these, the data fror 346,000 were available for followup. Subsequent followups were collected 11 and 50 years later. Marion Spengler and her colleagues Rodica Damian, and Brent Roberts reported on the stability and change across 50 years of personality and ability. Here is the correlation matrix of 25 of their variables (Spengler) as well as a slightly different set of 19 variables (Damian). This is a nice example of mediation and regression from a correlation matrix.

## Usage

```
data("Damian")
```

## Format

A 25 x 25 correlation matrix of demographic, personality, and ability variables, based upon 346,660 participants.

Race/Ethnicity  1 = other, 2 = white/caucasian

Sex  1=Male, 2=Female

Age  Cohort =9th grade, 10th grade, 11th grade, 12th grade

Parental  Parental SES based upon 9 questions of home value, family income, etc.

IQ  Standardized composite of Verbal, Spatial and Mathematical

Sociability etc.  10 scales based upon prior work by Damian and Roberts

Maturity  A higher order factor from the prior 10 scales

Extraversion  The second higher order factor

Interest  Self reported interest in school

Reading  Self report reading skills

Writing  Self report writing skills

Responsible  Self reported responsibility scale

Ed.11  Education level at 11 year followup

Educ.50  Education level at 50 year followup

OccPres.11 Occupational Prestige at 11 year followup

OccPres.50 Occupational Prestige at 50 year followup

Income.11 Income at 11 year followup

Income.50 Income at 50 year followup

## Details

Data from Project Talent was collected in 1960 on a representative sample of American high school students. Subsequent follow up 11 and 50 years later are reported by Spengler et al (2018) and others.

## Source

Marion Spengler, supplementary material to Damian et al. and Spengler et al.

spi                          *A sample from the SAPA Personality Inventory including an item dic-*
                             *tionary and scoring keys.*

---

## Description

The SPI (SAPA Personality Inventory) is a set of 135 items primarily selected from International Personality Item Pool (ipip.ori.org). This is an example data set collected using SAPA procedures the sapa-project.org web site. This data set includes 10 demographic variables as well. The data set with 4000 observations on 145 variables may be used for examples in scale construction and validation, as well as empirical scale construction to predict multiple criteria.

## Usage

```
data("spi")
data(spi.dictionary)
data(spi.keys)
```

## Format

A data frame with 4000 observations on the following 145 variables. (The q numbers are the SAPA item numbers).

age  Age in years from 11 -90

sex  Reported biological sex (coded by X chromosones => 1=Male, 2 = Female)

health  Self rated health 1-5: poor, fair, good, very good, excellent

p1edu  Parent 1 education

p2edu  Parent 2 education

education  Respondents education: less than 12, HS grad, current univ, some univ, associate degree, college degree, in grad/prof, grad/prof degree

wellness  Self rated "wellnes" 1-2

exer  Frequency of exercise: very rarely, < 1/month, < 1/wk, 1 or 2 times/week, 3-5/wk, > 5 times/week

smoke  never, not last year, < 1/month, <1/week, 1-3 days/week, most days, up to 5 x /day, up to 20 x /day, > 20x/day

ER  Emergency room visits none, 1x, 2x, 3 or more times

q_253  see the spi.dictionary for these items (q_253

q_1328  see the dictionary for all items q_1328)

## Details

Using the data contributed by about 125,000 visitors to the https://www.SAPA-project.org/ website, David Condon has developed a hierarchical framework for assessing personality at two levels. The higher level has the familiar five factors that have been studied extensively in personality research since the 1980s – Conscientiousness, Agreeableness, Neuroticism, Openness, and Extraversion. The lower level has 27 factors that are considerably more narrow. These were derived based on administrations of about 700 public-domain IPIP items to 3 large samples. Condon describes these scales as being "empirically-derived" because relatively little theory was used to select the number of factors in the hierarchy and the items in the scale for each factor (to be clear, he means relatively little personality theory though he relied on quite a lot of sampling and statistical theory). You can read all about the procedures used to develop this framework in his book/manual. If you would like to reproduce these analyses, you can download the data files from Dataverse (links are also provided in the manual) and compile this script in R (he used knitR). Instructions are provided in the Preface to the manual.

The content of the spi items may be seen by examining the spi.dictionary. Included in the dictionary are the item_id number from the SAPA project, the wording of the item, the source of the item, which Big 5 scale the item marks, and which "Little 27" scale the item marks.

This small subset of the data is provided for demonstration purposes.

An analysis using the spi data set and various tools from the psych package may be found at

Revelle, Dworak and Condon, (2021) Exploring the persome: the power of the item in understanding personality structure. Personality and Individual Differences, 169, 1. Doi: 10.1016/j.paid.2020.109905.

**Examples**

```
data(spi)
data(spi.dictionary)
psych::bestScales(spi, criteria="health",dictionary=spi.dictionary)

sc <- psych::scoreVeryFast(spi.keys,spi) #much faster scoring for just scores
sc <- psych::scoreOverlap(spi.keys,spi)  #gives the alpha reliabilities and various stats
      #these are corrected for overlap
psych::corPlot(sc$corrected,numbers=TRUE,cex=.4,xlas=2,min.length=6,
    main="Structure of SPI (Corrected for overlap) disattenuated r above the diagonal)")
```

---

usaf                              *17 anthropometric measures from the USAF showing a general factor*

---

**Description**

The correlation matrix of 17 anthropometric measures from the United States Air Force survey of 2420 airmen. The data are taken from the Anthropometry package and included here as a demonstration of a hierarchical factor structure suitable for analysis by the omega or omegaSem.

**Usage**

```
data("USAF")
```

**Format**

The format is: num [1:17, 1:17] 1 0.1148 -0.0309 -0.028 -0.0908 ... - attr(*, "dimnames")=List of 2 ..$ : chr [1:17] "age" "weight" "grip" "height" ... ..$ : chr [1:17] "age" "weight" "grip" "height" ...

## Details

The original data were collected by the USAF and reported in Churchill et al, 1977. They are included as a data file of 2420 participants and 202 variables (the first being an id) in the Anthropometry package. The list of variable names may be found in Churchill et al, on pages 99-103.

The three (correlated) factor structure shows a clear height, bulk, and head size structure with an overall general factor (g) which may be interpreted as body size.

The variables included (and their variable numbers in Anthropometry) are:

| | |
|---|---|
| age | V1 |
| weight | V2 |
| grip strength | V12 |
| height (stature) | V13 |
| leg length | V26 |
| knee height | V37 |
| upper arm | V42 |
| thumb tip reach | V47 |
| in sleeve | V49 |
| chest breadth | V52 |
| hip breadth | V55 |
| waist circumference | V71 |
| thigh circumference | V97 |
| scye circumference | V103 |
| head circumference | V141 |
| bitragion coronal | V145 |
| head length | V150 |
| glabella to wall | V181 |
| external canthus to wall | V183 |

Note that these numbers are equivalant to the numbers in Churchill et al. The numbers in Anthropometry are these + 1.

Utility                          *Useful utility functions for file/directory exploration and manipulation.*

---

#### Description

Wrappers for dirname, file.choose, readLines. file.create, file.path to be called directly for listing directories, creating files, showing the files in a directory, and listing the content of files in a directory. `fileCreate` gives the functionality of `file.choose`(new=TRUE). `filesList` combines file.choose, dirname, and list.files to show the files in a directory, `fileScan` extends this and then returns the first few lines of each readable file

#### Usage

```
fileScan(f = NULL, nlines = 3, max = NULL, from = 1, filter = NULL)
filesList(f=NULL)
filesInfo(f=NULL,max=NULL)
fileCreate(newName="new.file")
```

#### Arguments

| | |
|---|---|
| f | File path to use as base path (will use file.choose() if missing. If f is a directory, will list the files in that directory, if f is a file, will find the directory for that file and then list all of those files.) |
| nlines | How many lines to display |
| max | maximum number of files to display |
| from | First file (number) to display |
| filter | Just display files with "filter" in the name |
| newName | The name of the file to be created. |

#### Details

Just a collection of simple wrappers to powerful core R functions. Allows the user more direct control of what directory to list, to create a file, or to display the content of files. The functions called include `file.choose`, `file.path`, `file.info`,`file.create`, `dirname`, and `dir.exists`. All of these are very powerful functions, but not easy to call interactively.

`fileCreate` will ask to locate a file using file.choose, set the directory to that location, and then prompt to create a file with the new.name. This is a workaround for file.choose(new=TRUE) which only works for Macs not using R.studio.

`filesInfo` will interactively search for a file and then list the information (size, date, ownership) of all the files in that directory.

`filesList` will interactively search for a file and then list all the files in same directory.

## Note

Work arounds for core-R functions for interactive file manipulation

## Author(s)

William Revelle

## See Also

read.file to read in data from a file or read.clipboard from the clipboard. dfOrder to sort data.frames.

## Examples

```
if(interactive()) {
#all of these require interactive input and thus are not given as examples

fileCreate("my.new.file.txt")
filesList()  #show the items in the directory where a file is displayed
fileScan() #show the content of the files in a directory
#or, if you have a file in mind
 f <- file.choose()  #go find it
filesList(f)
fileScan(f)
}
```

---

vegetables                    *Paired comparison of preferences for 9 vegetables*

---

## Description

A classic data set for demonstrating Thurstonian scaling is the preference matrix of 9 vegetables from Guilford (1954). Used by Guiford, Nunnally, and Nunally and Bernstein, this data set allows for examples of basic scaling techniques.

## Usage

```
data(vegetables)
```

## Format

A data frame with 9 choices on the following 9 vegetables. The values reflect the perecentage of times where the column entry was preferred over the row entry.

Turn  Turnips

Cab  Cabbage

```
Beet  Beets
Asp  Asparagus
Car  Carrots
Spin  Spinach
S.Beans  String Beans
Peas  Peas
Corn  Corn
```

## Details

Louis L. Thurstone was a pioneer in psychometric theory and measurement of attitudes, interests, and abilities. Among his many contributions was a systematic analysis of the process of comparative judgment (thurstone, 1927). He considered the case of asking subjects to successively compare pairs of objects. If the same subject does this repeatedly, or if subjects act as random replicates of each other, their judgments can be thought of as sampled from a normal distribution of underlying (latent) scale scores for each object, Thurstone proposed that the comparison between the value of two objects could be represented as representing the differences of the average value for each object compared to the standard deviation of the differences between objects. The basic model is that each item has a normal distribution of response strength and that choice represents the stronger of the two response strengths. A justification for the normality assumption is that each decision represents the sum of many independent inputs and thus, through the central limit theorem, is normally distributed.

Thurstone considered five different sets of assumptions about the equality and independence of the variances for each item (Thurston, 1927). Torgerson expanded this analysis slightly by considering three classes of data collection (with individuals, between individuals and mixes of within and between) crossed with three sets of assumptions (equal covariance of decision process, equal correlations and small differences in variance, equal variances).

This vegetable data set is used by Guilford and by Nunnally to demonstrate Thurstonian scaling.

---

| vJoin | *Combine two matrices or data frames into one based upon variable labels* |
|---|---|

---

### Description

A typical problem in data analysis is to combine two data sets into one. vJoin will combine two matrices or data.frames into one data.frame. Unique column names from set 1 and set 2 are combined as are unique rows. Column names can differ, as can row names. Will match on rownames or a unique key vector. Basically an extension of rbind and cbind without the requirement of matching column and row names. combineMatrices solves a similar problem for correlation matrices.

### Usage

```
vJoin(x, y, rnames = TRUE, cnames=TRUE, key.name= NULL,by=NULL)
combineMatrices(x,y, r=NULL)
```

### Arguments

| | |
|---|---|
| x | a matrix or data frame with column and row names. |
| y | a matrix or data frame with column and row names |
| rnames | If TRUE, the default, match on row names, extend to new names. If FALSE then add the y data following the x data. |
| cnames | If TRUE colnames are NULL then create unique colnames for x and y |
| key.name | if NULL, match on rownames, otherwise, match on the values of the key.name column – must be unique |
| by | a grouping variable to be used in the merger |
| r | shoule we add the diagonal of y? |

### Details

For an X and Y matrices/data.frames with column and row names, combine the two data sets. Match on column and row names if they exist, extend to unique names if they do not match. Can also match on a column in each set (key.name)

Matrices by default do not have column or rownames. They will be created for x and for y (depending upon the rnames and cnames options).

combineMatrices takes a square matrix (x) and combines with a rectangular matrix y to produce a larger xy matrix.

### Value

xy: a data frame

### Note

Inspired by the functionality of full_join and the other related dplyr functions.

## Author(s)

William Revelle

## Examples

```
X1 <- bfi[1:10,1:5]
Y1 <- bfi[6:15,4:10]
xy <- vJoin(X1,Y1) #match on rownames
xy1 <- vJoin(X1,Y1,rnames=FALSE) #add Y1 items after X1 items

x <- matrix(1:30, ncol=5)
y <- matrix(1:40, ncol=8)
vJoin(x,y)
vJoin(x,y,cnames=FALSE)
vJoin(x,y, rnames= FALSE, cnames=FALSE)

temp <- vJoin(msqR,epiR,by="study")  #merge by study
table(temp$study,temp$time)

R <- cor(sat.act,use="pairwise")
r1 <- R[1:4,1:4]
r2 <- R[1:4,5:6]
newr <- combineMatrices(r1,r2)
```

---

zola                        *Correlation matrix of 135 self report and 30 peer report personality*
                            *items*

---

## Description

Zola et al., (2021) reported the validity of self report personality items from the SAPA personality
inventory (SPI) (Condon, 2018) in terms of 30 peer reports on 8 dimensions. Here are the poly-
choric correlations of these items. spi items were collected using SAPA procedures for 158,631
participants (mean n/item = 18,180), 908 of whom received peer ratings.

## Usage

```
data("zola")
```

## Format

The format is: num [1:165, 1:165] 1 -0.242 0.282 0.65 0.223 ... - attr(*, "dimnames")=List of 2 ..$
: chr [1:165] "q_253" "q_4296" "q_1855" "q_90" ... ..$ : chr [1:165] "q_253" "q_4296" "q_1855"
"q_90" ...

## Details

The polychoric correlation matrix of the spi and peer report data. To see the item labels, use the
`lookupFromKeys` .

This data set is a nice example of a multi-trait, multi-method correlation matrix. (see the scoring example). Five dimensions of self report show high correlations with the corresonding peer report scales.
